Case Narrative

Lab No: 20170165

This report contains the analytical results for the 3 sample(s) received under chain of custody by ESC Lab Sciences on 3/1/2017 2:12:51 PM. These samples are associated with your 1702267 project.

The analytical results included in this report meet all applicable quality control procedure requirements except as noted below:

The test results in this report meet all NELAC requirements unless noted below:

This report shall not be reproduced, except in full, without the written approval of ESC Lab Sciences.

All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client.

Results have been reviewed by the Director of Radiochemistry or their designees and is approved for release.

RE: Luminant - A-1 Landfill

Dear Will Vienne:

DHL Analytical, Inc. received 3 sample(s) on 3/25/2017 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAC except where noted in the Case Narrative. All non-NELAC methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-17-18

Subject: CCR Appendix III and IV
Follow Up Flag: Follow up
Flag Status: Completed

Hi John,

Here are the Appendix III and Appendix IV constituents that we will need to have analyzed under the CCR Rule.

Appendix III
Boron
Calcium
Chloride
Fluoride
pH
sulfate
TDS

Appendix IV
Antimony
Arsenic
Barium
Beryllium
Cadmium
Chromium
Cobalt
Fluoride
Lead
Lithium
Mercury
Molybdenum
Selenium
Thallium
Radium 226 and 228

We are looking to have approximately 74 wells sampled 8 times over the course of the next two years. Please let me know if there is any more information you might need.

Cheers,

Sara

DHL Analytical, Inc. **Date:** *25-Apr-17*

CLIENT: Pastor, Behling & Wheeler
Project: Luminant - A-1 Landfill
Lab Order: 1703205

CASE NARRATIVE

Samples were analyzed using the methods outlined in the following references:

Method SW6020A - Metals Analysis
Method SW7470A - Mercury Analysis
Method E300 - Anions Analysis
Method M4500-H+ B - pH of a Water Analysis
Method M2540C - TDS Analysis
Sub-contract - Radium-228 and Radium-226 analyses by methods E904/9320 and SM 7500 Ra B M. Analyzed at ESC Lab Sciences.

LOG IN

The samples were received and log-in performed on 3/25/17. A total of 3 samples were received. The samples arrived in good condition and were properly packaged.

METALS ANALYSIS

For Metals analysis performed on 3/29/17 the matrix spike recovery was slightly below control limits for Lithium. This is flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was from this work order. The LCS was within control limits for this analyte. No further corrective actions were taken.

For Metals analysis performed on 3/29/17 the PDS recovery was slightly below control limits for Lithium. This is flagged accordingly. The serial dilution was within control limits for this analyte. No further corrective actions were taken.

ANIONS ANALYSIS

For Anions analysis performed on 3/27/17 the matrix spike and matrix spike duplicate recoveries were slightly above control limits for Sulfate. These are flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was from this work order. The LCS was within control limits for this analyte. No further corrective actions were taken.

Case Narrative

Lab No: 20170261

This report contains the analytical results for the 3 sample(s) received under chain of custody by ESC Lab Sciences on 3/29/2017 11:08:22 AM. These samples are associated with your 1703205 project.

The analytical results included in this report meet all applicable quality control procedure requirements except as noted below:

The test results in this report meet all NELAC requirements unless noted below:

This report shall not be reproduced, except in full, without the written approval of ESC Lab Sciences.

All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client.

Results have been reviewed by the Director of Radiochemistry or their designees and is approved for release.

DL for Radiochemistry = MDA DL for Metals and Wet Chemistry = MDL DL for Drinking Water = SDWA

Observations / Nonconformances

RE: Luminant - A1 Landfill

Dear Will Vienne:

DHL Analytical, Inc. received 3 sample(s) on 4/26/2017 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAC except where noted in the Case Narrative. All non-NELAC methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-17-19

Subject: CCR Appendix III and IV
Follow Up Flag: Follow up
Flag Status: Completed

Hi John,

Here are the Appendix III and Appendix IV constituents that we will need to have analyzed under the CCR Rule.

Appendix III
Boron
Calcium
Chloride
Fluoride
pH
sulfate
TDS

Appendix IV
Antimony
Arsenic
Barium
Beryllium
Cadmium
Chromium
Cobalt
Fluoride
Lead
Lithium
Mercury
Molybdenum
Selenium
Thallium
Radium 226 and 228

We are looking to have approximately 74 wells sampled 8 times over the course of the next two years. Please let me know if there is any more information you might need.

Cheers,

Sara

Project: Luminant - A1 Landfill
Lab Order: 1704272

CASE NARRATIVE

Samples were analyzed using the methods outlined in the following references:

Method SW6020A - Metals Analysis
Method SW7470A - Mercury Analysis
Method E300 - Anions Analysis
Method M4500-H+ B - pH of a Water Analysis
Method M2540C - TDS Analysis
Sub-contract - Radium-228 and Radium-226 analyses by methods E904/9320 and SM 7500 Ra B M. Analyzed at ESC Lab Sciences.

LOG IN

The samples were received and log-in performed on 4/25/17. A total of 3 samples were received. The samples arrived in good condition and were properly packaged.

METALS ANALYSIS

For Metals analysis performed on 4/27/17 the matrix spike and matrix spike duplicate recoveries were above control limits for Calcium and/or Thallium. These are flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was not from this work order. The LCS was within control limits for these analytes. No further corrective actions were taken.

For Metals analysis performed on 4/27/17 the PDS recovery was above control limits for Calcium. This is flagged accordingly. The serial dilution was within control limits for this analyte. No further corrective actions were taken.

For Metals analysis performed on 4/27/17 and 5/10/17 the RPD for the serial dilution was above control limits for Selenium or Boron. These are flagged accordingly. The PDS was within control limits for these analytes. No further corrective actions were taken.

Case Narrative

Lab No: 20170351

This report contains the analytical results for the 3 sample(s) received under chain of custody by ESC Lab Sciences on 4/27/2017 10:09:14 AM. These samples are associated with your 1704272 project.

The analytical results included in this report meet all applicable quality control procedure requirements except as noted below:

The test results in this report meet all NELAC requirements unless noted below:

This report shall not be reproduced, except in full, without the written approval of ESC Lab Sciences.

All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client.

Results have been reviewed by the Director of Radiochemistry or their designees and is approved for release.

DL for Radiochemistry = MDA DL for Metals and Wet Chemistry = MDL DL for Drinking Water = SDWA

Observations / Nonconformances

L905308

RE: Luminant A-1

Dear Will Vienne:

DHL Analytical, Inc. received 3 sample(s) on 5/26/2017 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAC except where noted in the Case Narrative. All non-NELAC methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-17-19

Subject:	CCR Appendix III and IV
Follow Up Flag:	Follow up
Flag Status:	Completed

Hi John,

Here are the Appendix III and Appendix IV constituents that we will need to have analyzed under the CCR Rule.

Appendix III
Boron
Calcium
Chloride
Fluoride
pH
sulfate
TDS

Appendix IV
Antimony
Arsenic
Barium
Beryllium
Cadmium
Chromium
Cobalt
Fluoride
Lead
Lithium
Mercury
Molybdenum
Selenium
Thallium
Radium 226 and 228

We are looking to have approximately 74 wells sampled 8 times over the course of the next two years. Please let me know if there is any more information you might need.

Cheers,

Sara

DHL Analytical, Inc. **Date:** *22-Jun-17*

CLIENT: Pastor, Behling & Wheeler
Project: Luminant A-1
Lab Order: 1705286

CASE NARRATIVE

Samples were analyzed using the methods outlined in the following references:

Method SW6020A - Metals Analysis
Method SW7470A - Mercury Analysis
Method E300 - Anions Analysis
Method M4500-H+ B - pH of a Water Analysis
Method M2540C - TDS Analysis
Sub-contract - Radium-228 and Radium-226 analyses by methods E904/9320 and SM 7500 Ra B M. Analyzed at ESC Lab Sciences.

LOG IN

The samples were received and log-in performed on 5/26/17. A total of 3 samples were received. The samples arrived in good condition and were properly packaged.

METALS ANALYSIS

For Metals analysis performed on 6/6/17 the matrix spike and matrix spike duplicate recoveries were below control limits for Boron. These are flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was not from this work order. The LCS was within control limits for this analyte. No further corrective actions were taken.

ANIONS ANALYSIS

For Anions analysis performed on 6/1/17 the matrix spike and matrix spike duplicate recoveries were slightly above control limits for Fluoride. These are flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was not from this work order. The LCS was within control limits for this analyte. No further corrective actions were taken.

Case Narrative

Lab No: 20170479

This report contains the analytical results for the 3 sample(s) received under chain of custody by ESC Lab Sciences on 5/30/2017 11:30:35 AM. These samples are associated with your 1705286 project.

The analytical results included in this report meet all applicable quality control procedure requirements except as noted below:

The test results in this report meet all NELAC requirements unless noted below:

This report shall not be reproduced, except in full, without the written approval of ESC Lab Sciences.

All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client.

Results have been reviewed by the Director of Radiochemistry or their designees and is approved for release.

DL for Radiochemistry = MDA DL for Metals and Wet Chemistry = MDL DL for Drinking Water = SDWA

Observations / Nonconformances

L913295
The following QC parameters are outside method control limits:
MSD %REC Radium-226 SDG# R1241

RE: Beckville Mine

Dear Will Vienne:

DHL Analytical, Inc. received 3 sample(s) on 6/30/2017 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAC except where noted in the Case Narrative. All non-NELAC methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-17-19

Subject: CCR Appendix III and IV
Follow Up Flag: Follow up
Flag Status: Completed

Hi John,

Here are the Appendix III and Appendix IV constituents that we will need to have analyzed under the CCR Rule.

Appendix III
Boron
Calcium
Chloride
Fluoride
pH
sulfate
TDS

Appendix IV
Antimony
Arsenic
Barium
Beryllium
Cadmium
Chromium
Cobalt
Fluoride
Lead
Lithium
Mercury
Molybdenum
Selenium
Thallium
Radium 226 and 228

We are looking to have approximately 74 wells sampled 8 times over the course of the next two years. Please let me know if there is any more information you might need.

Cheers,

Sara

CASE NARRATIVE

Samples were analyzed using the methods outlined in the following references:

Method SW6020A - Metals Analysis
Method SW7470A - Mercury Analysis
Method E300 - Anions Analysis
Method M4500-H+ B - pH of a Water Analysis
Method M2540C - TDS Analysis
Sub-contract - Radium-228 and Radium-226 analyses by methods E904/9320 and SM 7500 Ra B M. Analyzed at ESC Lab Sciences.

LOG IN

The samples were received and log-in performed on 6/30/17. A total of 3 samples were received. The samples arrived in good condition and were properly packaged.

METALS ANALYSIS

For Metals analysis performed on 7/13/17 the matrix spike and matrix spike duplicate recoveries were out of control limits for three analytes. These are flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was from this work order. The LCS was within control limits for these analytes. No further corrective actions were taken.

For Metals analysis performed on 7/13/17 the RPD for the serial dilution was slightly above control limits for Boron. This is flagged accordingly. The PDS was within control limits for this analyte. No further corrective actions were taken.

ANIONS ANALYSIS

For Anions analysis performed on 7/12/17 the matrix spike recovery (1706346-03 MS) was above control limits for Sulfate. This is flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was from this work order. The LCS was within control limits for this analyte. No further corrective actions were taken.

TDS ANALYSIS

For TDS analysis all samples were analyzed one day outside of HoldTime due to log-in error. All TDS results are flagged with a "C" to designate this.

Case Narrative

Lab No: 20170619

This report contains the analytical results for the 3 sample(s) received under chain of custody by ESC Lab Sciences on 7/5/2017 4:18:40 PM. These samples are associated with your 1706346 project.

The analytical results included in this report meet all applicable quality control procedure requirements except as noted below:

The test results in this report meet all NELAC requirements unless noted below:

This report shall not be reproduced, except in full, without the written approval of ESC Lab Sciences.

All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client.

Results have been reviewed by the Director of Radiochemistry or their designees and is approved for release.

DL for Radiochemistry = MDA DL for Metals and Wet Chemistry = MDL DL for Drinking Water = SDWA

Observations / Nonconformances

RE: A-1 Landfill (Luminant)

Dear Will Vienne:

DHL Analytical, Inc. received 1 sample(s) on 8/3/2017 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAC except where noted in the Case Narrative. All non-NELAC methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-17-19

CASE NARRATIVE

Samples were analyzed using the methods outlined in the following references:

Method SW6020A - Metals Analysis
Method SW7470A - Mercury Analysis
Method E300 - Anions Analysis
Method M4500-H+ B - pH of a Water Analysis
Method M2540C - TDS Analysis
Sub-contract - Radium-228 and Radium-226 analyses by methods E904/9320 and SM 7500 Ra B M. Analyzed at ESC Lab Sciences.

LOG IN

The sample was received and log-in performed on 8/3/17. A total of 1 sample was received. The sample arrived in good condition and was properly packaged.

METALS ANALYSIS

For Metals analysis the matrix spike, matrix spike duplicate and PDS had low responses for the internal standard Bismuth. The associated analyte (Lead) was within control limits for these QC samples. No further corrective actions were taken.

For Metals analysis performed on 8/8/17 and 8/9/17 the matrix spike and matrix spike duplicate recoveries were out of control limits for a total of four analytes. These are flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was not from this work order. The LCS was within control limits for these analytes. No further corrective actions were taken.

Case Narrative

Lab No: 20170734

This report contains the analytical results for the 1 sample(s) received under chain of custody by ESC Lab Sciences on 8/7/2017 11:47:14 AM. These samples are associated with your 1708050 project.

The analytical results included in this report meet all applicable quality control procedure requirements except as noted below:

The test results in this report meet all NELAC requirements unless noted below:

This report shall not be reproduced, except in full, without the written approval of ESC Lab Sciences.

All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client.

Results have been reviewed by the Director of Radiochemistry or their designees and is approved for release.

DL for Radiochemistry = MDA DL for Metals and Wet Chemistry = MDL DL for Drinking Water = SDWA

Observations / Nonconformances

Data Usability Summary
Luminant – Martin Lake Steam Electric Station
October 20-30, 2015
Groundwater Monitoring Event
DHL Analytical Data Packages 1510216, 1510228, and 1511007

Pastor, Behling & Wheeler, LLC reviewed three data packages from DHL Analytical for the analysis of groundwater samples collected October 20-30, 2015 at the Martin Lake Steam Electric Station in Tatum, Texas. Data were reviewed for adherence to project objectives.

Intended Use of Data: To provide current data on concentrations of chemicals of concern (COCs) in the groundwater at the site.

Analyses requested included:

- Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Lead, Lithium, Molybdenum, Selenium, and Thallium by USEPA Method SW6020A – Metals Analysis;
- Chloride, Fluoride, and Sulfate by USEPA Method E300 – Anion Analysis;
- Mercury by USEPA Method SW7470A – Mercury Analysis;
- pH of Water by Standard Method M4500-H + B – pH of Water Analysis;
- Total Dissolved Solids (TDS) by Standard Method M2540C – TDS Analysis; and
- Radium 226 and 228 by USEPA Methods 904.0/SW846 9320 Modified and 903.1 Modified.

Data were reviewed and validated and the results of the review/validation are discussed in this Data Usability Summary (DUS). The following laboratory submittals and field data were examined:

- the reportable data,
- case narratives, and
- field notes with respect to field instrument calibrations, filtering procedures, sampling procedures, and preservation procedures prior to shipping the samples to the laboratory.

The results of supporting quality control (QC) analyses were summarized in the case narrative, included in this review, with the laboratory data package.

Introduction

Twenty five (25) groundwater samples were analyzed for the constituents listed above (Appendix III and Appendix IV constituents in the Coal Combustion Residuals Federal Rule). Table B-1 lists the field sample identifications cross-referenced to the laboratory identifications.

Project Objectives

Project quality QC objectives were established in conformance to the requirements of *SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods* and *Standard Methods*. Laboratory control sample and sample duplicate recovery QC criteria were 70 – 130% recovery (%R) for metals and inorganics. Laboratory recovery QC criteria were 30% Relative Percent Difference (RPD). Field duplicate recovery QC criteria were 50% RPD.

Data Review / Validation Results

Analytical Results

Non-detected results (ND) are reported as less than the value of the method detection limit (MDL) and received a "U" flag. Analytes detected between the method quantitation limit (MQL) and the MDL were qualified with a "J-flag" to denote that the reported value was considered to be estimated. If a QC result was found outside of the review criteria, the reviewer applied a data qualifier and bias code to the associated sample data if the analyte was detected. Sample data were not qualified if recoveries exceeded QC criteria and the analyte was not detected.

Preservation and Holding Times

Samples were evaluated for agreement with the chain-of-custody (COC). All samples were received in the appropriate containers and in good condition with the paperwork filled out properly. Sample receipt temperatures were within the acceptance criteria of 4 ± 2 °C. Samples were prepared and analyzed within holding times as specified in the analysis methods.

Calibrations

The initial and continuing calibration data met laboratory control limits with the exception of the following:

For Metals analysis performed on 11/5/2015 and 11/9/2015, four LCVLs were above control limits for Boron. These are flagged accordingly. The associated CCVs were within control limits for this analyte. No further corrective actions were taken.

For Metals analysis performed on 11/3/2015, LCVL3-151103 was above control limits for Boron and Calcium. This was due to sample carryover. The affected samples were the matrix spike and matrix spike duplicate. No further corrective actions were taken.

For Metals analysis performed on 11/9/2015, LCVL2-151109 was slightly above control limits for Calcium. This is flagged accordingly. The associated CCV2-151109 was within control limits for this analyte. No further corrective actions were taken.

Blanks

No field blanks were used because the sampling event did not include volatile or semi-volatile compounds.

All laboratory method blank results were reported as non-detected or below applicable assessment levels with the exception of the following:

For Metals analysis performed on 11/5/2015 Chromium and Molybdenum were detected above the reporting limits in the method blank. All associated samples were below detection limits for these analytes. No further corrective actions were taken.

For Metals analysis performed on 11/9/2015 Boron was detected below the reporting limit in the method blank. All samples were detected greater than 10 times the amount in the blank for this analyte. No further corrective actions were taken.

No equipment blank was collected

Internal Standards

For Metals analysis samples BMW-19 and BMW-18 had low responses for the internal standards Indium and Bismuth. All associated analytes (Barium, Cadmium, Molybdenum, and Lead) were not reported from this analytical run and were re-analyzed.

Surrogate Recoveries

The analytical procedures used did not require surrogates; therefore, surrogate recovery is not applicable.

Laboratory Control Samples

Laboratory control sample (LCS) recoveries were within QC acceptance limits for all LCS analyses.

Matrix Spike/Matrix Spike Duplicates

MS/MSD percent recoveries were within acceptable control limits for all samples with the exception of the following:

For Metals analysis performed on 11/3/2015 the matrix spike and matrix spike duplicate recoveries were out of control limits for Calcium, and the matrix spike duplicate recovery was out of control limits for Antimony. In addition, the matrix spike and matrix spike duplicate had the RPD above control limits for Antimony. These are flagged accordingly in the QC summary report. The sample selected for the MS and MSD was not from this work order. The LCS was within control limits for these analytes. No further corrective actions were taken.

For Metals analysis performed on 11/9/2015 the matrix spike and matrix spike duplicate recoveries were out of control limits for Calcium. These are flagged accordingly in the QC summary report. The sample selected for the MS and MSD was not from this work order. The LCS was within control limits for this analyte. No further corrective actions were taken.

For Mercury analysis for lab package 1511007 the matrix spike and matrix spike duplicate was re-prepped and re-analyzed on 11/10/2015. This was due to a prep error. This exceeded the 24 hour prep window.

Serial Dilution/Post Dilution Spike

For Metals analysis performed on 11/9/2015 the RPD for the serial dilution was above control limits for Chromium. This is flagged accordingly. The PDS was within control limits for this analyte. No further corrective actions were taken.

Field Precision

No sample duplicates were taken during this sampling event.

Field Procedures

Groundwater samples were collected using low-flow procedures with a peristaltic, stainless steel submersible pump, or bladder pump and placed in unpreserved 250-ml plastic bottles and 500-ml plastic bottles preserved with HNO_3. Wells were purged until groundwater parameters (temperature, pH, specific conductivity, dissolved oxygen, redox, and turbidity) stabilized to within +/- 10%.

Summary

Groundwater analytical data are usable for the purpose of determining current COC concentrations in the groundwater at the site with no qualifications added as a result of this evaluation.

Data Usability Summary
Luminant – Martin Lake Steam Electric Station
December 30, 2015
Groundwater Monitoring Event
DHL Analytical Data Package 1512359

Pastor, Behling & Wheeler, LLC reviewed one data package from DHL Analytical for the analysis of groundwater samples collected December 30, 2015 at the Martin Lake Steam Electric Station in Tatum, Texas. Data were reviewed for adherence to project objectives.

Intended Use of Data: To provide current data on concentrations of chemicals of concern (COCs) in the groundwater at the site.

Analyses requested included:

- Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Lead, Lithium, Molybdenum, Selenium, and Thallium by USEPA Method SW6020A – Metals Analysis;
- Chloride, Fluoride, and Sulfate by USEPA Method E300 – Anion Analysis;
- Mercury by USEPA Method SW7470A – Mercury Analysis;
- pH of Water by Standard Method M4500-H + B – pH of Water Analysis;
- Total Dissolved Solids (TDS) by Standard Method M2540C – TDS Analysis; and
- Radium 226 and 228 by USEPA Methods 904.0/SW846 9320 Modified and 903.1 Modified.

Data were reviewed and validated and the results of the review/validation are discussed in this Data Usability Summary (DUS). The following laboratory submittals and field data were examined:

- the reportable data,
- case narratives, and
- field notes with respect to field instrument calibrations, filtering procedures, sampling procedures, and preservation procedures prior to shipping the samples to the laboratory.

The results of supporting quality control (QC) analyses were summarized in the case narrative, included in this review, with the laboratory data package.

Introduction

Eight (8) groundwater samples were analyzed for the constituents listed above (Appendix III and Appendix IV constituents in the Coal Combustion Residuals Federal Rule). Table B-1 lists the field sample identifications cross-referenced to the laboratory identifications.

Project Objectives

Project quality QC objectives were established in conformance to the requirements of *SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods* and *Standard Methods*. Laboratory control sample and sample duplicate recovery QC criteria were 70 – 130% recovery (%R) for metals and inorganics. Laboratory recovery QC criteria were 30% Relative Percent Difference (RPD). Field duplicate recovery QC criteria were 50% RPD.

Data Review / Validation Results

Analytical Results

Non-detected results (ND) are reported as less than the value of the method detection limit (MDL) and received a "U" flag. Analytes detected between the method quantitation limit (MQL) and the MDL were qualified with a "J-flag" to denote that the reported value was considered to be estimated. If a QC result was found outside of the review criteria, the reviewer applied a data qualifier and bias code to the associated sample data if the analyte was detected. Sample data were not qualified if recoveries exceeded QC criteria and the analyte was not detected.

Preservation and Holding Times

Samples were evaluated for agreement with the chain-of-custody (COC). All samples were received in the appropriate containers and in good condition with the paperwork filled out properly. Sample receipt temperatures were within the acceptance criteria of 4 ± 2 °C. Samples were prepared and analyzed within holding times as specified in the analysis methods.

Calibrations

The initial and continuing calibration data met laboratory control limits.

Blanks

No field blanks were used because the sampling event did not include volatile or semi-volatile compounds.

All laboratory method blank results were reported as non-detected or below applicable assessment levels.

No equipment blank was collected.

Surrogate Recoveries

The analytical procedures used did not require surrogates; therefore, surrogate recovery is not applicable.

Laboratory Control Samples

Laboratory control sample (LCS) recoveries were within QC acceptance limits for all LCS analyses.

Matrix Spike/Matrix Spike Duplicates

MS/MSD percent recoveries were within acceptable control limits for all samples with the exception of the following:

For Metals analysis performed on 1/11/2016 the matrix spike and matrix spike duplicate recoveries were out of control limits for Calcium, and for analysis performed on 1/14/2016 the matrix spike and matrix spike duplicate recoveries were out of control limits for Boron. These are flagged accordingly in the QC summary report. The sample selected for the MS and MSD was from this work order. The LCS was within control limits for these analytes. No further corrective actions were taken.

Serial Dilution/Post Dilution Spike

For Mercury analysis performed on 1/5/2016 the PDS recover was below control limits. This is flagged accordingly. The serial dilution was within control limits. No further corrective actions were taken.

Field Precision

No sample duplicates were taken during this sampling event.

Field Procedures

Groundwater samples were collected using low-flow procedures with a peristaltic, stainless steel submersible pump, or bladder pump and placed in unpreserved 250-ml plastic bottles and 500-ml plastic bottles preserved with HNO_3. Wells were purged until groundwater parameters (temperature, pH, specific conductivity, dissolved oxygen, redox, and turbidity) stabilized to within +/- 10%.

Summary

Groundwater analytical data are usable for the purpose of determining current COC concentrations in the groundwater at the site with no qualifications added as a result of this evaluation.

- Total Dissolved Solids (TDS) by Standard Method M2540C – TDS Analysis; and
- Radium 226 and 228 by USEPA Methods 904.0/SW846 9320 Modified and 903.1 Modified.

Data were reviewed and validated and the results of the review/validation are discussed in this Data Usability Summary (DUS). The following laboratory submittals and field data were examined:

- the reportable data,
- case narratives, and
- field notes with respect to field instrument calibrations, filtering procedures, sampling procedures, and preservation procedures prior to shipping the samples to the laboratory.

The results of supporting quality control (QC) analyses were summarized in the case narrative, included in this review, with the laboratory data package.

Introduction

Eight (8) groundwater samples were analyzed for the constituents listed above (Appendix III and Appendix IV constituents in the Coal Combustion Residuals Federal Rule). Table B-1 lists the field sample identifications cross-referenced to the laboratory identifications.

Project Objectives

Project quality QC objectives were established in conformance to the requirements of *SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods* and *Standard Methods*. Laboratory control sample and sample duplicate recovery QC criteria were 70 – 130% recovery (%R) for metals and inorganics. Laboratory recovery QC criteria were 30% Relative Percent Difference (RPD). Field duplicate recovery QC criteria were 50% RPD.

Data Review / Validation Results

Analytical Results

Non-detected results (ND) are reported as less than the value of the method detection limit (MDL) and received a "U" flag. Analytes detected between the method quantitation limit (MQL) and the MDL were qualified with a "J-flag" to denote that the reported value was considered to be estimated. If a QC result was found outside of the review criteria, the reviewer applied a data qualifier and bias code to the associated sample data if the analyte was detected. Sample data were not qualified if recoveries exceeded QC criteria and the analyte was not detected.

Preservation and Holding Times

Samples were evaluated for agreement with the chain-of-custody (COC). All samples were received in the appropriate containers and in good condition with the paperwork filled out properly. Sample receipt temperatures were within the acceptance criteria of 4 ± 2 °C. Samples were prepared and analyzed within holding times as specified in the analysis methods.

Calibrations

The initial and continuing calibration data met laboratory control limits.

Blanks

No field blanks were used because the sampling event did not include volatile or semi-volatile compounds.

All laboratory method blank results were reported as non-detected or below applicable assessment levels.

No equipment blank was collected.

Surrogate Recoveries

The analytical procedures used did not require surrogates; therefore, surrogate recovery is not applicable.

Laboratory Control Samples

Laboratory control sample (LCS) recoveries were within QC acceptance limits for all LCS analyses.

Matrix Spike/Matrix Spike Duplicates

MS/MSD percent recoveries were within acceptable control limits for all samples with the exception of the following:

For Metals analysis performed on 6/17/2016 and 6/23/2016 the matrix spike and matrix spike duplicate recoveries were outside control limits for Boron, Calcium, and Lithium. These are flagged accordingly in the QC summary report. The sample selected for the MS and MSD was not from this work order. The LCS was within control limits for these analytes. No further corrective actions were taken.
For Mercury analysis performed on 4/12/2016 the matrix spike and matrix spike duplicate recoveries were below control limits. These are flagged accordingly in the QC summary report. The sample selected for the MS/MSD was from this work order. The LCS was within control limits. No further corrective actions were taken.

Serial Dilution/Post Dilution Spike

For Metals analysis performed on 6/17/2016 the PDS recovery was below control limits for Molybdenum. This is flagged accordingly. The serial dilution was within control limits. No further corrective actions were taken.

Field Precision

No sample duplicates were taken during this sampling event.

Field Procedures

Groundwater samples were collected using low-flow procedures with a peristaltic, stainless steel submersible pump, or bladder pump and placed in unpreserved 250-ml plastic bottles and 500-ml plastic bottles preserved with HNO_3. Wells were purged until groundwater parameters (temperature, pH, specific conductivity, dissolved oxygen, redox, and turbidity) stabilized to within +/- 10%.

Summary

Groundwater analytical data are usable for the purpose of determining current COC concentrations in the groundwater at the site with no qualifications added as a result of this evaluation.

Data Usability Summary
Luminant – Martin Lake Steam Electric Station
August 9-11, 2016
Groundwater Monitoring Event
DHL Analytical Data Package 1608133

Pastor, Behling & Wheeler, LLC reviewed one data package from DHL Analytical for the analysis of groundwater samples collected August 9-11, 2016 at the Martin Lake Steam Electric Station in Tatum, Texas. Data were reviewed for adherence to project objectives.

Intended Use of Data: To provide current data on concentrations of chemicals of concern (COCs) in the groundwater at the site.

Analyses requested included:

- Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Lead, Lithium, Molybdenum, Selenium, and Thallium by USEPA Method SW6020A – Metals Analysis;
- Chloride, Fluoride, and Sulfate by USEPA Method E300 – Anion Analysis;
- Mercury by USEPA Method SW7470A – Mercury Analysis;
- pH of Water by Standard Method M4500-H + B – pH of Water Analysis;
- Total Dissolved Solids (TDS) by Standard Method M2540C – TDS Analysis; and
- Radium 226 and 228 by USEPA Methods 904.0/SW846 9320 Modified and 903.1 Modified.

Data were reviewed and validated and the results of the review/validation are discussed in this Data Usability Summary (DUS). The following laboratory submittals and field data were examined:

- the reportable data,
- case narratives, and
- field notes with respect to field instrument calibrations, filtering procedures, sampling procedures, and preservation procedures prior to shipping the samples to the laboratory.

The results of supporting quality control (QC) analyses were summarized in the case narrative, included in this review, with the laboratory data package.

Introduction

Twenty seven (27) groundwater samples were analyzed for the constituents listed above (Appendix III and Appendix IV constituents in the Coal Combustion Residuals Federal Rule). Table B-1 lists the field sample identifications cross-referenced to the laboratory identifications.

Project Objectives

Project quality QC objectives were established in conformance to the requirements of *SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods* and *Standard Methods*. Laboratory control sample and sample duplicate recovery QC criteria were 70 – 130% recovery (%R) for metals and inorganics. Laboratory recovery QC criteria were 30% Relative Percent Difference (RPD). Field duplicate recovery QC criteria were 50% RPD.

Data Review / Validation Results

Analytical Results

Non-detected results (ND) are reported as less than the value of the method detection limit (MDL) and received a "U" flag. Analytes detected between the method quantitation limit (MQL) and the MDL were qualified with a "J-flag" to denote that the reported value was considered to be estimated. If a QC result was found outside of the review criteria, the reviewer applied a data qualifier and bias code to the associated sample data if the analyte was detected. Sample data were not qualified if recoveries exceeded QC criteria and the analyte was not detected.

Preservation and Holding Times

Samples were evaluated for agreement with the chain-of-custody (COC). All samples were received in the appropriate containers and in good condition with the paperwork filled out properly. Sample receipt temperatures were within the acceptance criteria of 4 ± 2 °C. Samples were prepared and analyzed within holding times as specified in the analysis methods.

Calibrations

The initial and continuing calibration data met laboratory control limits with the exception of the following:

For Metals analysis performed on 8/18/2016 and 8/22/2016 LCVL3-160818 and LCVL2-160822 were out of control limits for Boron and Beryllium, respectively. These are flagged accordingly. The associated CCV3-160818 and CCV2-160822 were within control limits for these analytes. No further corrective actions were taken.

Blanks

No field blanks were used because the sampling event did not include volatile or semi-volatile compounds.

All laboratory method blank results were reported as non-detected or below applicable assessment levels.

One equipment blank was collected, with all results being below applicable assessment levels.

Surrogate Recoveries

The analytical procedures used did not require surrogates; therefore, surrogate recovery is not applicable.

Laboratory Control Samples

Laboratory control sample (LCS) recoveries were within QC acceptance limits for all LCS analyses.

Matrix Spike/Matrix Spike Duplicates

MS/MSD percent recoveries were within acceptable control limits for all samples with the exception of the following:

For Metals analysis (batch 76817) the matrix spike and matrix spike duplicate had low responses for the internal standard Bismuth. The associated analyte (Lead) was within control limits. No further corrective actions were taken.

For Metals analysis performed on 8/17/2016, 8/19/2016, 8/22/2016, 8/23/2016, and 8/24/2016, the matrix spike and matrix spike duplicate recoveries were outside control limits for a total of nine analytes. These are flagged accordingly in the QC summary report. The samples selected for the MS and MSD were not from this work order. The LCSs were within control limits for these analytes. No further corrective actions were taken.

Serial Dilution/Post Dilution Spikes

For Metals analysis performed on 8/23/2016, the PDS recovery was below control limits for Lithium. This is flagged accordingly. The serial dilution was within control limits for this analyte. No further corrective actions were taken.

Field Precision

Field duplicate precision met the quality objective of RPDs <50% for the pair collected at H-30 for all constituents.

Analytical testing for Radium 226 and 228 has reported inherent variability. The lab reports a result and a margin of error. To determine the acceptability of the duplicate sample, the margin of error for combined Radium is added and subtracted from the result to give a range in which the true result lies. If the parent range and duplicate range overlap, the duplicate data is considered acceptable. The parent and duplicate range overlap, and the duplicate data is considered acceptable.

Field Procedures

Groundwater samples were collected using low-flow procedures with a peristaltic, stainless steel submersible pump, or bladder pump and placed in unpreserved 250-ml plastic bottles and 500-ml plastic bottles preserved with HNO_3. Wells were purged until groundwater parameters (temperature, pH, specific conductivity, dissolved oxygen, redox, and turbidity) stabilized to within +/- 10%.

Summary

Groundwater analytical data are usable for the purpose of determining current COC concentrations in the groundwater at the site with no qualifications added as a result of this evaluation.

Data Usability Summary
Luminant – Martin Lake Steam Electric Station
October 25-26, 2016
Groundwater Monitoring Event
DHL Analytical Data Packages 1610230 & 1610240

Pastor, Behling & Wheeler, LLC reviewed two data packages from DHL Analytical for the analysis of groundwater samples collected October 25-26, 2016 at the Martin Lake Steam Electric Station in Tatum, Texas. Data were reviewed for adherence to project objectives.

Intended Use of Data: To provide current data on concentrations of chemicals of concern (COCs) in the groundwater at the site.

Analyses requested included:

- Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Lead, Lithium, Molybdenum, Selenium, and Thallium by USEPA Method SW6020A – Metals Analysis;
- Chloride, Fluoride, and Sulfate by USEPA Method E300 – Anion Analysis;
- Mercury by USEPA Method SW7470A – Mercury Analysis;
- pH of Water by Standard Method M4500-H + B – pH of Water Analysis;
- Total Dissolved Solids (TDS) by Standard Method M2540C – TDS Analysis; and
- Radium 226 and 228 by USEPA Methods 904.0/SW846 9320 Modified and 903.1 Modified.

Data were reviewed and validated and the results of the review/validation are discussed in this Data Usability Summary (DUS). The following laboratory submittals and field data were examined:

- the reportable data,
- case narratives, and
- field notes with respect to field instrument calibrations, filtering procedures, sampling procedures, and preservation procedures prior to shipping the samples to the laboratory.

The results of supporting quality control (QC) analyses were summarized in the case narrative, included in this review, with the laboratory data package.

Introduction

Ten (10) groundwater samples were analyzed for the constituents listed above (Appendix III and Appendix IV constituents in the Coal Combustion Residuals Federal Rule). Table B-1 lists the field sample identifications cross-referenced to the laboratory identifications.

Project Objectives

Project quality QC objectives were established in conformance to the requirements of *SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods* and *Standard Methods*. Laboratory control sample and sample duplicate recovery QC criteria were 70 – 130% recovery (%R) for metals and inorganics. Laboratory recovery QC criteria were 30% Relative Percent Difference (RPD). Field duplicate recovery QC criteria were 50% RPD.

Data Review / Validation Results

Analytical Results

Non-detected results (ND) are reported as less than the value of the method detection limit (MDL) and received a "U" flag. Analytes detected between the method quantitation limit (MQL) and the MDL were qualified with a "J-flag" to denote that the reported value was considered to be estimated. If a QC result was found outside of the review criteria, the reviewer applied a data qualifier and bias code to the associated sample data if the analyte was detected. Sample data were not qualified if recoveries exceeded QC criteria and the analyte was not detected.

Preservation and Holding Times

Samples were evaluated for agreement with the chain-of-custody (COC). All samples were received in the appropriate containers and in good condition with the paperwork filled out properly. Sample receipt temperatures were within the acceptance criteria of 4 ± 2 °C. Samples were prepared and analyzed within holding times as specified in the analysis methods.

Calibrations

The initial and continuing calibration data met laboratory control limits for all constituents.

Blanks

No field blanks were used because the sampling event did not include volatile or semi-volatile compounds.

All laboratory method blank results were reported as non-detected or below applicable assessment levels with the exception of the following:

For Metals analysis performed on 11/9/2016 Calcium was detected above the reporting limit in the method blank (MB-77818). All samples were detected greater than 10 times the amount in the blank for this analyte. No further corrective actions were taken.

No equipment blank was collected.

Surrogate Recoveries

The analytical procedures used did not require surrogates; therefore, surrogate recovery is not applicable.

Laboratory Control Samples

Laboratory control sample (LCS) recoveries were within QC acceptance limits for all LCS analyses.

Matrix Spike/Matrix Spike Duplicates

MS/MSD percent recoveries were within acceptable control limits for all samples with the exception of the following:

For Metals analysis performed on 11/4/2016 the matrix spike recoveries for Antimony and Boron were outside of control limits. Additionally, the matrix spike and matrix spike duplicate had the RPD above control limits for Antimony and Boron. These are flagged accordingly in the QC summary report. The

sample selected for the MS and MSD was not from this work order. The LCS was within control limits for these analytes. No further corrective actions were taken.

Serial Dilution/Post Dilution Spikes

For Metals analysis performed on 11/8/2016 the RPD for the serial dilution was above control limits for Boron. This is flagged accordingly. The PDS was within control limits for this analyte. No further corrective actions were taken.

For Metals analysis performed on 11/9/2016 the RPD for the serial dilution was above control limits for Boron. This is flagged accordingly. The PDS was within control limits for this analyte. No further corrective actions were taken.

Field Precision

No sample duplicates were collected during this sampling event.

Field Procedures

Groundwater samples were collected using low-flow procedures with a peristaltic, stainless steel submersible pump, or bladder pump and placed in unpreserved 250-ml plastic bottles and 500-ml plastic bottles preserved with HNO_3. Wells were purged until groundwater parameters (temperature, pH, specific conductivity, dissolved oxygen, redox, and turbidity) stabilized to within +/- 10%.

Summary

Groundwater analytical data are usable for the purpose of determining current COC concentrations in the groundwater at the site with no qualifications added as a result of this evaluation.

Data Usability Summary
Luminant – Martin Lake Steam Electric Station
December 13-14, 2016
Groundwater Monitoring Event
DHL Analytical Data Packages 1612145 & 1612207

Pastor, Behling & Wheeler, LLC reviewed two data packages from DHL Analytical for the analysis of groundwater samples collected December 13-14, 2016 at the Martin Lake Steam Electric Station in Tatum, Texas. Data were reviewed for adherence to project objectives.

Intended Use of Data: To provide current data on concentrations of chemicals of concern (COCs) in the groundwater at the site.

Analyses requested included:

- Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Lead, Lithium, Molybdenum, Selenium, and Thallium by USEPA Method SW6020A – Metals Analysis;
- Chloride, Fluoride, and Sulfate by USEPA Method E300 – Anion Analysis;
- Mercury by USEPA Method SW7470A – Mercury Analysis;
- pH of Water by Standard Method M4500-H + B – pH of Water Analysis;
- Total Dissolved Solids (TDS) by Standard Method M2540C – TDS Analysis; and
- Radium 226 and 228 by USEPA Methods 904.0/SW846 9320 Modified and 903.1 Modified.

Data were reviewed and validated and the results of the review/validation are discussed in this Data Usability Summary (DUS). The following laboratory submittals and field data were examined:

- the reportable data,
- case narratives, and
- field notes with respect to field instrument calibrations, filtering procedures, sampling procedures, and preservation procedures prior to shipping the samples to the laboratory.

The results of supporting quality control (QC) analyses were summarized in the case narrative, included in this review, with the laboratory data package.

Introduction

Ten (10) groundwater samples were analyzed for the constituents listed above (Appendix III and Appendix IV constituents in the Coal Combustion Residuals Federal Rule). Table B-1 lists the field sample identifications cross-referenced to the laboratory identifications.

Project Objectives

Project quality QC objectives were established in conformance to the requirements of *SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods* and *Standard Methods*. Laboratory control sample and sample duplicate recovery QC criteria were 70 – 130% recovery (%R) for metals and inorganics. Laboratory recovery QC criteria were 30% Relative Percent Difference (RPD). Field duplicate recovery QC criteria were 50% RPD.

Data Review / Validation Results

Analytical Results

Non-detected results (ND) are reported as less than the value of the method detection limit (MDL) and received a "U" flag. Analytes detected between the method quantitation limit (MQL) and the MDL were qualified with a "J-flag" to denote that the reported value was considered to be estimated. If a QC result was found outside of the review criteria, the reviewer applied a data qualifier and bias code to the associated sample data if the analyte was detected. Sample data were not qualified if recoveries exceeded QC criteria and the analyte was not detected.

Preservation and Holding Times

Samples were evaluated for agreement with the chain-of-custody (COC). All samples were received in the appropriate containers and in good condition with the paperwork filled out properly. Sample receipt temperatures were within the acceptance criteria of 4 ± 2 °C. Samples were prepared and analyzed within holding times as specified in the analysis methods.

Calibrations

The initial and continuing calibration data met laboratory control limits for all constituents with the exception of the following:

For Metals analysis performed on 12/29/2016 LCVL7-161229 was above control limits for Calcium. This is flagged accordingly. The associated CCV was within control limits for this analyte. No further corrective actions were taken.

Blanks

No field blanks were used because the sampling event did not include volatile or semi-volatile compounds.

All laboratory method blank results were reported as non-detected or below applicable assessment levels.

One equipment blank was collected, with all results being below applicable assessment levels.

Surrogate Recoveries

The analytical procedures used did not require surrogates; therefore, surrogate recovery is not applicable.

Laboratory Control Samples

Laboratory control sample (LCS) recoveries were within QC acceptance limits for all LCS analyses.

Matrix Spike/Matrix Spike Duplicates

MS/MSD percent recoveries were within acceptable control limits for all samples with the exception of the following:

For Metals analysis performed on 12/29/2016 the matrix spike and matrix spike duplicate recoveries for Calcium were outside of control limits. This is flagged accordingly in the QC summary report. The sample selected for the MS and MSD was from this work order. The LCS was within control limits. No further corrective actions were taken.

For Mercury analysis performed on 12/22/2016 the matrix spike and matrix spike duplicate recoveries were blow control limits. This is flagged accordingly in the QC summary report. The sample selected for the MS and MSD was from this work order. The LCS was within control limits. No further corrective actions were taken.

Serial Dilution/Post Dilution Spikes

For Metals analysis performed on 12/29/2016 the RPD for the serial dilution was above control limits for Boron, Barium, and Lithium. These are flagged accordingly. The PDS was within control limits for these analytes. No further corrective actions were taken.

Field Precision

No sample duplicates were collected during this sampling event.

Field Procedures

Groundwater samples were collected using low-flow procedures with a peristaltic, stainless steel submersible pump, or bladder pump and placed in unpreserved 250-ml plastic bottles and 500-ml plastic bottles preserved with HNO_3. Wells were purged until groundwater parameters (temperature, pH, specific conductivity, dissolved oxygen, redox, and turbidity) stabilized to within +/- 10%.

Summary

Groundwater analytical data are usable for the purpose of determining current COC concentrations in the groundwater at the site with no qualifications added as a result of this evaluation.

Data Usability Summary
Luminant – Martin Lake Steam Electric Station
January 23, 2017
Groundwater Monitoring Event
DHL Analytical Data Package 1701222

Pastor, Behling & Wheeler, LLC reviewed one data package from DHL Analytical for the analysis of groundwater samples collected January 23, 2017 at the Martin Lake Steam Electric Station in Tatum, Texas. Data were reviewed for adherence to project objectives.

Intended Use of Data: To provide current data on concentrations of chemicals of concern (COCs) in the groundwater at the site.

Analyses requested included:

- Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Lead, Lithium, Molybdenum, Selenium, and Thallium by USEPA Method SW6020A – Metals Analysis;
- Chloride, Fluoride, and Sulfate by USEPA Method E300 – Anion Analysis;
- Mercury by USEPA Method SW7470A – Mercury Analysis;
- pH of Water by Standard Method M4500-H + B – pH of Water Analysis;
- Total Dissolved Solids (TDS) by Standard Method M2540C – TDS Analysis; and
- Radium 226 and 228 by USEPA Methods 904.0/SW846 9320 Modified and 903.1 Modified.

Data were reviewed and validated and the results of the review/validation are discussed in this Data Usability Summary (DUS). The following laboratory submittals and field data were examined:

- the reportable data,
- case narratives, and
- field notes with respect to field instrument calibrations, filtering procedures, sampling procedures, and preservation procedures prior to shipping the samples to the laboratory.

The results of supporting quality control (QC) analyses were summarized in the case narrative, included in this review, with the laboratory data package.

Introduction

Three (3) groundwater samples were analyzed for the constituents listed above (Appendix III and Appendix IV constituents in the Coal Combustion Residuals Federal Rule). Table B-1 lists the field sample identifications cross-referenced to the laboratory identifications.

Project Objectives

Project quality QC objectives were established in conformance to the requirements of *SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods* and *Standard Methods*. Laboratory control sample and sample duplicate recovery QC criteria were 70 – 130% recovery (%R) for metals and inorganics. Laboratory recovery QC criteria were 30% Relative Percent Difference (RPD). Field duplicate recovery QC criteria were 50% RPD.

Data Review / Validation Results

Analytical Results

Non-detected results (ND) are reported as less than the value of the method detection limit (MDL) and received a "U" flag. Analytes detected between the method quantitation limit (MQL) and the MDL were qualified with a "J-flag" to denote that the reported value was considered to be estimated. If a QC result was found outside of the review criteria, the reviewer applied a data qualifier and bias code to the associated sample data if the analyte was detected. Sample data were not qualified if recoveries exceeded QC criteria and the analyte was not detected.

Preservation and Holding Times

Samples were evaluated for agreement with the chain-of-custody (COC). All samples were received in the appropriate containers and in good condition with the paperwork filled out properly. Sample receipt temperatures were within the acceptance criteria of 4 ± 2 °C. Samples were prepared and analyzed within holding times as specified in the analysis methods.

Calibrations

The initial and continuing calibration data met laboratory control limits for all constituents.

Blanks

No field blanks were used because the sampling event did not include volatile or semi-volatile compounds.

All laboratory method blank results were reported as non-detected or below applicable assessment levels.

No equipment blanks were collected during this sampling event.

Surrogate Recoveries

The analytical procedures used did not require surrogates; therefore, surrogate recovery is not applicable.

Laboratory Control Samples

Laboratory control sample (LCS) recoveries were within QC acceptance limits for all LCS analyses.

Matrix Spike/Matrix Spike Duplicates

MS/MSD percent recoveries were within acceptable control limits for all samples with the exception of the following:

For Metals analysis performed on 2/7/2017 the matrix spike and matrix spike duplicate recoveries were out of control limits for Boron and Calcium. These are flagged accordingly in the QC summary report. The sample selected for the MS and MSD was not from this work order. The LCS was within control limits for this analyte. No further corrective actions were taken.

For Mercury analysis performed on 2/1/2017 the matrix spike and matrix spike duplicate recoveries were below control limits. This was due to matrix effect. These are flagged accordingly in the QC summary report. The sample selected for the MS and MSD was from this work order. The LCS was within control limits. No further corrective actions were taken.

Serial Dilution/Post Dilution Spikes

For Metals analysis performed on 2/7/2017, the PDS recovery was out of control limits for Boron and Calcium. These are flagged accordingly. The serial dilution was within control limits for these analytes. No further corrective actions were taken.

For Mercury analysis performed on 2/1/2017, the PDS recovery was below control limits. This was due to matrix effect. This is flagged accordingly. The serial dilution was within control limits. No further corrective actions were taken.

Field Precision

No sample duplicates were taken during this sampling event.

Field Procedures

Groundwater samples were collected using low-flow procedures with a peristaltic, stainless steel submersible pump, or bladder pump and placed in unpreserved 250-ml plastic bottles and 500-ml plastic bottles preserved with HNO_3. Wells were purged until groundwater parameters (temperature, pH, specific conductivity, dissolved oxygen, redox, and turbidity) stabilized to within +/- 10%.

Summary

Groundwater analytical data are usable for the purpose of determining current COC concentrations in the groundwater at the site with no qualifications added as a result of this evaluation.

Groundwater Monitoring Event
DHL Analytical Data Package 1702267

Pastor, Behling & Wheeler, LLC reviewed one data package from DHL Analytical for the analysis of groundwater samples collected February 23, 2017 at the Martin Lake Steam Electric Station in Tatum, Texas. Data were reviewed for adherence to project objectives.

Intended Use of Data: To provide current data on concentrations of chemicals of concern (COCs) in the groundwater at the site.

Analyses requested included:

- Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Lead, Lithium, Molybdenum, Selenium, and Thallium by USEPA Method SW6020A – Metals Analysis;
- Chloride, Fluoride, and Sulfate by USEPA Method E300 – Anion Analysis;
- Mercury by USEPA Method SW7470A – Mercury Analysis;
- pH of Water by Standard Method M4500-H + B – pH of Water Analysis;
- Total Dissolved Solids (TDS) by Standard Method M2540C – TDS Analysis; and
- Radium 226 and 228 by USEPA Methods 904.0/SW846 9320 Modified and 903.1 Modified.

Data were reviewed and validated and the results of the review/validation are discussed in this Data Usability Summary (DUS). The following laboratory submittals and field data were examined:

- the reportable data,
- case narratives, and
- field notes with respect to field instrument calibrations, filtering procedures, sampling procedures, and preservation procedures prior to shipping the samples to the laboratory.

The results of supporting quality control (QC) analyses were summarized in the case narrative, included in this review, with the laboratory data package.

Introduction

Three (3) groundwater samples were analyzed for the constituents listed above (Appendix III and Appendix IV constituents in the Coal Combustion Residuals Federal Rule). Table B-1 lists the field sample identifications cross-referenced to the laboratory identifications.

Project Objectives

Project quality QC objectives were established in conformance to the requirements of *SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods* and *Standard Methods*. Laboratory control sample and sample duplicate recovery QC criteria were 70 – 130% recovery (%R) for metals and inorganics. Laboratory recovery QC criteria were 30% Relative Percent Difference (RPD). Field duplicate recovery QC criteria were 50% RPD.

Data Review / Validation Results

Analytical Results

Non-detected results (ND) are reported as less than the value of the method detection limit (MDL) and received a "U" flag. Analytes detected between the method quantitation limit (MQL) and the MDL were qualified with a "J-flag" to denote that the reported value was considered to be estimated. If a QC result was found outside of the review criteria, the reviewer applied a data qualifier and bias code to the associated sample data if the analyte was detected. Sample data were not qualified if recoveries exceeded QC criteria and the analyte was not detected.

Preservation and Holding Times

Samples were evaluated for agreement with the chain-of-custody (COC). All samples were received in the appropriate containers and in good condition with the paperwork filled out properly. Sample receipt temperatures were within the acceptance criteria of 4 ± 2 °C. Samples were prepared and analyzed within holding times as specified in the analysis methods.

Calibrations

The initial and continuing calibration data met laboratory control limits for all constituents.

Blanks

No field blanks were used because the sampling event did not include volatile or semi-volatile compounds.

All laboratory method blank results were reported as non-detected or below applicable assessment levels.

No equipment blanks were collected during this sampling event.

Surrogate Recoveries

The analytical procedures used did not require surrogates; therefore, surrogate recovery is not applicable.

Laboratory Control Samples

Laboratory control sample (LCS) recoveries were within QC acceptance limits for all LCS analyses.

Matrix Spike/Matrix Spike Duplicates

MS/MSD percent recoveries were within acceptable control limits for all samples with the exception of the following:

For Metals analysis performed on 3/2/2017 and 3/3/2017, the matrix spike and matrix spike duplicate recoveries were out of control limits for nine analytes. Additionally, the MS/MSD had the RPD above control limits for Antimony. These are flagged accordingly in the QC summary report. The sample selected for the MS and MSD was not from this work order. The LCS was within control limits for this analyte. No further corrective actions were taken.

Serial Dilution/Post Dilution Spikes

SD/PDS percent recoveries were within acceptable control limits for all samples.

Field Precision

No sample duplicates were taken during this sampling event.

Field Procedures

Groundwater samples were collected using low-flow procedures with a peristaltic, stainless steel submersible pump, or bladder pump and placed in unpreserved 250-ml plastic bottles and 500-ml plastic bottles preserved with HNO_3. Wells were purged until groundwater parameters (temperature, pH, specific conductivity, dissolved oxygen, redox, and turbidity) stabilized to within +/- 10%.

Summary

Groundwater analytical data are usable for the purpose of determining current COC concentrations in the groundwater at the site with no qualifications added as a result of this evaluation.

August 1, 2017
Groundwater Monitoring Event
DHL Analytical Data Package 1708050

Pastor, Behling & Wheeler, LLC reviewed one data package from DHL Analytical for the analysis of groundwater samples collected August 1, 2017 at the Martin Lake Steam Electric Station in Tatum, Texas. Data were reviewed for adherence to project objectives.

Intended Use of Data: To provide current data on concentrations of chemicals of concern (COCs) in the groundwater at the site.

Analyses requested included:

- Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Lead, Lithium, Molybdenum, Selenium, and Thallium by USEPA Method SW6020A – Metals Analysis;
- Chloride, Fluoride, and Sulfate by USEPA Method E300 – Anion Analysis;
- Mercury by USEPA Method SW7470A – Mercury Analysis;
- pH of Water by Standard Method M4500-H + B – pH of Water Analysis;
- Total Dissolved Solids (TDS) by Standard Method M2540C – TDS Analysis; and
- Radium 226 and 228 by USEPA Methods 904.0/SW846 9320 Modified and 903.1 Modified.

Data were reviewed and validated and the results of the review/validation are discussed in this Data Usability Summary (DUS). The following laboratory submittals and field data were examined:

- the reportable data,
- case narratives, and
- field notes with respect to field instrument calibrations, filtering procedures, sampling procedures, and preservation procedures prior to shipping the samples to the laboratory.

The results of supporting quality control (QC) analyses were summarized in the case narrative, included in this review, with the laboratory data package.

Introduction

One (1) groundwater sample was analyzed for the constituents listed above (Appendix III and Appendix IV constituents in the Coal Combustion Residuals Federal Rule). Table B-1 lists the field sample identifications cross-referenced to the laboratory identifications.

Project Objectives

Project quality QC objectives were established in conformance to the requirements of *SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods* and *Standard Methods*. Laboratory control sample and sample duplicate recovery QC criteria were 70 – 130% recovery (%R) for metals and inorganics. Laboratory recovery QC criteria were 30% for Relative Percent Difference (RPD). Field duplicate recovery QC criteria were 50% RPD.

Data Review / Validation Results

Analytical Results

Non-detected results (ND) are reported as less than the value of the method detection limit (MDL) and received a "U" flag. Analytes detected between the method quantitation limit (MQL) and the MDL were qualified with a "J-flag" to denote that the reported value was considered to be estimated. If a QC result was found outside of the review criteria, the reviewer applied a data qualifier and bias code to the associated sample data if the analyte was detected. Sample data were not qualified if recoveries exceeded QC criteria and the analyte was not detected.

Preservation and Holding Times

Samples were evaluated for agreement with the chain-of-custody (COC). All samples were received in the appropriate containers and in good condition with the paperwork filled out properly. Sample receipt temperatures were within the acceptance criteria of 4 ± 2 °C. Samples were prepared and analyzed within holding times as specified in the analysis methods.

Calibrations

The initial and continuing calibration data met laboratory control limits for all constituents.

Blanks

No field blanks were used because the sampling event did not include volatile or semi-volatile compounds.

All laboratory method blank results were reported as non-detected or below applicable assessment levels.

No equipment blanks were collected during this sampling event.

Surrogate Recoveries

The analytical procedures used did not require surrogates; therefore, surrogate recovery is not applicable.

Laboratory Control Samples

Laboratory control sample (LCS) recoveries were within QC acceptance limits for all LCS analyses.

Matrix Spike/Matrix Spike Duplicates

MS/MSD percent recoveries were within acceptable control limits for all samples with the exception of the following:

For Metals analysis performed on 8/9/2017 the matrix spike and/or matrix spike duplicate recoveries were above or below control limits for boron, calcium, and lithium. This is flagged accordingly in the QC summary report. The LCS results were within control limits for all analytes. No further corrective actions were taken.

Serial Dilution/Post Dilution Spikes

SD/PDS percent recoveries were within acceptable control limits for all samples.

Field Precision

No sample duplicates were taken during this sampling event.

Field Procedures

Groundwater samples were collected using low-flow procedures with a peristaltic, stainless steel submersible pump, or bladder pump and placed in unpreserved 250-ml plastic bottles and 500-ml plastic bottles preserved with HNO_3. Wells were purged until groundwater parameters (temperature, pH, specific conductivity, dissolved oxygen, redox, and turbidity) stabilized to within +/- 10%.

Summary

Groundwater analytical data are usable for the purpose of determining current COC concentrations in the groundwater at the site with no qualifications added as a result of this evaluation.

APPENDIX C

Statistical Approach to Establishing Baseline Concentrations

Appendix C. STATISTICAL APPROACH TO ESTABLISHING BASELINE CONCENTRATIONS

This appendix summarizes the statistical approach used for establishing baseline groundwater quality concentrations for the A1 Area Landfill Coal Combustion Residual (CCR) groundwater monitoring system. The following statistical approach was selected to demonstrate groundwater compliance under the CCR Rule:

- Use of interwell data evaluations, which compare new sample data to data from upgradient or background monitoring wells.

- Use of upper prediction limits (UPLs) to develop site-specific background concentrations for all Appendix III and Appendix IV constituents. This approach is a common statistical method used to evaluate groundwater compliance for Subtitle D landfill facilities and is one of the approved options for groundwater quality data statistical evaluations under the CCR Rule.

- After every detection monitoring event, Appendix III constituent concentrations from each compliance well are compared to background UPLs to ascertain if a statistically significant increase above background exists. Background UPLs are based on a 1-of-2 resampling approach, meaning that if one or more constituent concentrations in a compliance well are above their respective baseline concentration, a resample can be collected to validate or invalidate the baseline concentration exceedance.

- If assessment monitoring is required, the 95% lower confidence limit of the mean (LCL) is calculated after each assessment monitoring event for each Appendix IV constituent and compliance well. The data set used to calculate LCLs is based on current and historical constituent concentrations for a compliance well. A statistically significant increase over the Groundwater Protection Standard (GWPS) has occurred at a CCR unit when the LCL for at least one assessment monitoring constituent at a well is greater than the appropriate GWPS. Development of the GWPSs is discussed in Section C.4.

This approach follows the Statistical Analysis Plan-Revision 1 (SAP) (Golder, 2022) and conforms to the 40 CFR 257 rules as well as EPA's *Unified Guidance: Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities* (EPA, 2009) (hereafter, referred to as the Unified Guidance) and the American Society for Testing and Materials (ASTM) standard D6312-17, *Developing Appropriate Statistical Approaches for Groundwater Detection Monitoring Programs at waste Disposal Facilities* (ASTM, 2017). The statistical methodology is designed to detect a release from the facility at the earliest indication so that it is protective of human health and the environment.

Section 257.94(b) of the CCR Rule requires that a minimum of eight independent groundwater samples from each background and downgradient well be collected and analyzed for the constituents listed in Appendix III and IV to Part 257 no later than October 17, 2017. To satisfy this requirement, at least eight groundwater monitoring events were performed from October 2015 through August 2017 using upgradient/background well (BMW-11-AR) and ten downgradient compliance wells (BMW-18, BMW-19, BMW-20, BMW-21, BMW-22, BMW-23, BMW-24, BMW-26, BMW-27, BMW-28) in the A1 Area Landfill CCR monitoring well system. Well BMW-33 was added to the CCR monitoring well system as an upgradient well in 2021 (BBA, 2024), but it was not sampled during the initial baseline period and was, therefore, not used to establish background concentrations.

Prior to performing background data evaluations, data from the upgradient well were prepared for analysis. Methods for handling field duplicate samples and handling non-detects were implemented during this data preparation phase, as presented in Section C.1. Statistical assumptions were evaluated to assess the independence of background data prior to calculating the UPLs, as discussed in Section C.2. In order to calculate UPLs, the distribution of each data set was defined and a site-wide Type I experiment wise error rate was established. UPLs based on a 1-of-2 resampling approach were calculated for detected constituents to establish baseline values for the well hydraulically upgradient of the CCR unit, as further described in Section C.3. Details about the approach used to evaluate detection and assessment monitoring data after baseline concentrations were established are provided in Section C.4.

C.1 Data Preparation

Analytical data from wells in the groundwater monitoring network at a CCR unit during each sampling event are first reviewed for usability after final data packages are received from the laboratory. The analytical data are then prepared for statistical analysis. The raw sample data can be found in Tables C-1 and C-2 for the Appendix III and Appendix IV constituents, respectively.

Methods for handling duplicate and non-detect data are implemented during this data preparation phase to comply with the performance standards outlined in 40 CFR 257.93. Field duplicates and data rejected after data validation are removed from the data set. Only the primary samples are retained for the statistical evaluation.

In accordance with EPA guidance, non-detects were handled by using one of two approaches depending on the percentage of detected concentrations:

- If a constituent was detected in at least 85% of samples, a simple substitution method was used in which half of the sample detection limit was substituted as a proxy concentration (EPA, 2009; EPA, 2000).

- If a constituent was detected in at least 50% of the samples but no more than 85% of the samples, the Robust Regression Order Statistics (RROS) method was used to estimate summary statistics such as the mean and standard deviation (EPA, 2009).

If the constituent was detected in fewer than 50% of the samples, non-detects were handled by using nonparametric statistical approaches to evaluate the data and to prepare summary statistics (EPA, 2009; EPA, 2000). J-flagged data, estimated concentrations between the sample detection limit and the reporting limit, were defined as detected concentrations.

C.2 Statistical Assumptions

In accordance with Section 257.94(6), the background groundwater sample data used in calculating the UPLs were evaluated for seasonal variability as well as temporal correlation in the data to assess the independence and usability of the background data to calculate UPLs. An evaluation for spatial variation was not necessary and not conducted for A1 Area Landfill since baseline concentrations were estimated using one upgradient well (BMW-11-AR). Statistical independence was checked by testing for:

- Temporal stationarity,
- Lack of autocorrelation, and
- Lack of statistical data outliers.

The statistical software **R** (The R Foundation, 2023) and the EnvStats package (Envstats, 2023) were used to perform the statistical tests to check the validity of independent samples.

To identify the statistical significance across the detected Appendix III or Appendix IV constituents, a Type I experiment wise error rate, α, of 0.05 was used and a single test error rate was defined for each statistical test. The single test error rate, was based on the number of constituents detected (d^*), and in some cases the number of constituents detected at least 50% of the time, for a given constituent list.

For instance, the single test error rate associated with a statistical test for one of the seven detected Appendix III constituents (d^*=7) equals $1-(1-\alpha)^{1/d^*} = 1-(1-\alpha)^{1/7} = 0.0073$.

Temporal stationarity and autocorrelation components are considered addressed after evaluation of the background data as a whole, showing general consistency with the data obtained. For A1 Area Landfill, no linear trend or autocorrelation was identified at upgradient well BMW-11-AR for Appendix III or Appendix IV constituents. Since there are no cases with significant trends and/or autocorrelation, the data are, therefore, considered usable.

Handling Outliers

Outliers are "extreme, unusual-looking measurements" and the Unified Guidance recommends testing for outliers to attempt to determine whether a suspect outlier was drawn from the same sample population as the rest of the data.

Before establishing baseline values for the detection monitoring or assessment monitoring programs, two steps were taken to check for suspect outliers for each detected constituent in the upgradient well: a box plot was created to identify suspect outliers as a basis to identify suspect outliers, and if the constituent had at least 50% detected concentrations then the Dixon's test was performed as a formal test to check if a suspect outlier is also a statistical outlier. Box plots and results for the Dixon's test were generated using the statistical software **R** (The R Foundation, 2023). Box plots are provided in Figures C-1 through C-15 and Table C-3 presents the suspect outliers based on the box plots and presents the results from the Dixon's test, based on a 95% level of confidence.

The suspect outliers based on box plots for Appendix III are chloride (one low concentration of 2.39 mg/L) and fluoride (one high concentration of 0.26 J mg/L). The suspect outliers identified for Appendix IV are arsenic (one high concentration of 0.0116 mg/L), cobalt (one high concentration of 0.0124 mg/L), fluoride (one high concentration of 0.26 J mg/ L), and lead (one high concentration of 0.00347 mg/L). The Dixon's test is appropriate for data sets of fewer than 25 samples, and so Dixon's test was used to evaluate outliers in the baseline data sets. Since there were less than 50% detects for fluoride, cobalt, and lead, the Dixon's test was not performed. The Dixon's test assumes that a data set with the suspect outlier removed is normally distributed (or lognormally distributed if the data are transformed to the natural-log scale). The Dixon's test was used to test if the suspect outliers for chloride and arsenic were statistical outliers. For chloride, the results of the Dixon's test did not indicate that the low suspect

outlier was a statistical outlier. For arsenic, the results of the Dixon's tests indicated that the suspect outlier was also considered a statistical outlier. Although the high arsenic concentration was identified as a statistical outlier, it is within the range of baseline concentrations for downgradient wells and is considered representative of background conditions upgradient of the CCR unit. Therefore, suspect and statistical outliers were not removed from the baseline data set.

C.3 Statistical Approach for Calculating UPLs

UPLs were calculated for each detected constituent in the upgradient well to establish baseline values for background. UPLs were calculated to include a 1-of-2 retesting strategy to ensure comparisons are statistically powerful and to achieve the site-wide false positive rate (SWFPR). A 1-of-2 retesting strategy means that if one or more constituent concentrations in a compliance well are above their respective baseline concentration, a resample can be collected to validate or invalidate the baseline concentration exceedance.

Background data distributions were defined in accordance with EPA guidance (EPA, 2000; EPA, 2002; EPA, 2009; EPA, 2017; SWDIV, 1998). UPLs were calculated based on the SWFPR and defined background data distribution. Power rates were defined for each calculated UPL. The open source, statistical software **R** (The R Foundation, 2023) was used to perform all statistical distribution tests and to calculate UPLs.

<u>Achieving the SWFPR</u>

UPLs were computed using a significance level that ensures a cumulative SWFPR or Type I experiment wise error rate for yearly monitoring that is no more than 10%. That means, a single test error rate for the UPLs must be considerably lower than 0.10. The single test error rate depends on the number of detected constituents and number of compliance wells evaluated in the CCR monitoring program, defined as: $1-(1-\alpha)^{1/cw}$, where

- α=0.10,
- c=7 or 12, the number detected constituents for the monitoring program for Appendix III and Appendix IV constituents, respectively; and
- w=10, the number of downgradient compliance wells at A1 Area Landfill.

The single test error rate for the UPLs is 0.0015 and 0.00088 for the detected Appendix III constituents and Appendix IV constituents, respectively. The Unified Guidance recommends defining the single test error rate for nonparametric UPLs as: $1-(1-\alpha)^{1/c}$, and so the single test error rate for nonparametric UPLs is 0.015 and 0.0087 for the detected Appendix III constituents and Appendix IV constituents, respectively. Since field pH has two bounds, a lower and upper prediction limit, the SWPFR for field pH is one-half of the appropriate SWFPR value shown above.

Defining a Distribution and Type of UPL

The type of UPL calculated is based on a data set's defined distribution. Figure C-16 outlines the steps that were taken to define whether a data set follows a normal, gamma, lognormal, or nonparametric distribution. Distributional test results and defined distributions are presented in Table C-4.

The type of UPL computed (e.g., parametric or nonparametric) was based on the detection frequency and the defined data distribution. For a constituent with no detections in the baseline data, the UPL was set to the reporting limit (EPA, 2009). For a constituent with at least 50% detections, the UPL was adjusted for non-detected concentration(s), as described previously in the Data Preparation section, Section C.1, and the appropriate UPL calculation was based on results from the distributional tests. If no parametric distribution (normal, gamma, or lognormal) was appropriate, then a nonparametric UPL was estimated. The confidence level used for each UPL was based on the appropriate single test error rate.

Defining Power Rate Associated with Each UPL

The power of each UPL was evaluated and a power rate was defined as good, acceptable, or low. A power rate was defined as 'good' when the power at both 3 standard deviations and 4 standard deviations were above 85%; a power rate was defined as 'acceptable' when power at either 3 standard deviations or 4 standard deviations was between 59% and 85%; and a power rate was defined as 'low' occurs when power at both 3 standard deviations and 4 standard deviations were below 85%.

C.4 Detection and Assessment Monitoring Data Evaluations

Detection and assessment monitoring constituent concentrations are compared to the appropriate baseline value for background or GWPS to determine whether a significant difference exists between the initial and current site conditions. The appropriate baseline value for detection monitoring is the Appendix III constituent's UPL and the appropriate baseline value for assessment monitoring is the

Appendix IV constituent's GWPS (Table C-5). The GWPS for each Appendix IV constituent is established as follows:

- For constituents with an established MCL, the GWPS is the highest of the MCL, UPL, or laboratory reporting limit for that constituent; or
- For constituents with no established MCL, the GWPS is the highest of the UPL, laboratory reporting limit, and alternative GWPS (as applicable for cobalt, lead, lithium, and molybdenum).

For detection monitoring, a well is defined as in-compliance when all the Appendix III constituent concentrations are less than the appropriate baseline value. If any concentration exceeds the appropriate baseline value, then a resample may be collected, analyzed, and compared to the appropriate baseline value—if this resample exceeds the appropriate baseline value, then a statistically significant increase over background is indicated.

For assessment monitoring, a 95% confidence interval of the mean is estimated for each detected Appendix IV constituent in a downgradient well using the current and previous sampling event concentrations. The confidence interval contains both a LCL and an upper confidence limit (UCL). The Unified guidance states that "for testing under compliance/assessment monitoring, a [LCL] around the true parameter is utilized. If the LCL exceeds the standard [GWPS], there is statistically significant evidence in favor that the compliance standard has been violated." A constituent is in-compliance when the LCL for the constituent is less than the appropriate GWPS. (EPA, 2009).

The 95% confidence interval (i.e., the LCL and UCL) is based on the constituent concentrations from the current year's sampling events and historical sampling events at a given well. Confidence intervals are calculated based on the defined data distribution. The data distribution is defined in accordance with EPA guidance (EPA, 2000; EPA, 2002; EPA, 2009; EPA, 2017; SWDIV, 1998). The type of confidence interval computed (e.g., parametric or nonparametric) is based on the detection frequency and the defined data distribution for each data set, as described in Section C.3. For a constituent with no detected concentration measurements, the LCL (and UCL) is set to the reporting limit (EPA, 2009). For a constituent with at least 50% detections, the LCL (and UCL) calculation adjusts for non-detected concentration(s) as described in Section C.1, and the appropriate LCL (and UCL) calculation is used based on results from the distributional tests. If no parametric distribution (normal, lognormal, or gamma) can be defined for a data set or there are fewer than 50% detections, then a nonparametric, approximate 95% confidence interval of the median is estimated for the LCL and UCL.

	Lead	High	0.00347 mg/L (2016-12-14)	--	--	--	--	--	--	--	--	Not Performed, <50% Detects

NOTE: APPENDIX F-Revision 2 February 27, 2024

Dixon's Test can be performed for only one value.

Statistical Significance for Distributional tests for Dixon's test are based on 95% level of confidence, or α=0.05.

Table C-4. Summary of Distributional Tests

1.0 INTRODUCTION

Luminant Power (Luminant) operates the Martin Lake Steam Electric Station (MLSES) located approximately 5 miles southeast of Tatum, Rusk County, Texas (Figure 1). The MLSES consists of three coal-fired power generation units. Coal Combustion Residuals (CCRs) including fly ash, bottom ash and gypsum are generated as part of the MLSES unit operations. Currently, CCRs generated at the MLSES are transported off-site for beneficial reuse by third-parties or are managed by Luminant in surface impoundments located on the MLSES property or the A1 Area Landfill located approximately 2.5 miles east of the MLSES. This report discusses the Ash Pond Area (the Site), which includes the West Ash Pond (WAP), East Ash Pond (EAP), and the New Scrubber Pond, which are all located on the MLSES property.

The federal CCR Rule (Title 40 Code of Federal Regulations (CFR) Section 257 Subpart D - *Standards for the Receipt of Coal Combustion Residuals in Landfills and Surface Impoundments*) has been promulgated by the United States Environmental Protection Agency (USEPA) to regulate the management and disposal of CCRs as solid waste under Resource Conservation and Recovery Act (RCRA) Subtitle D. The final CCR Rule was published in the Federal Register on April 17, 2015. The effective date of the CCR Rule is October 19, 2015. TCEQ adopted portions of the Federal CCR Rule at Title 30 Texas Administrative Code (TAC) Chapter 352 (Texas CCR Rule). The USEPA published its final approval of the Texas CCR Rule on June 28, 2021 and the Texas CCR Rule became effective on July 28, 2021. It adopts and incorporates by reference the Federal CCR Program requirements for groundwater monitoring at 30 TAC Sections 352.901 through 352.951.

The CCR Rule establishes national minimum criteria for existing and new CCR landfills, existing and new CCR surface impoundments, and lateral expansions to landfills/impoundments. 40 C.F.R § 257.93(d) of the CCR Rule requires that the owner or operator of the CCR unit must establish background groundwater quality in a hydraulically upgradient or background well(s) for each of the constituents required in the particular groundwater monitoring program that applies to the CCR unit as determined under 40 C.F.R § 257.94(a) (*Detection Monitoring Program)* and 40 C.F.R § 257.95(a) (*Assessment Monitoring Program)*. 40 C.F.R § 257.94(b) of the CCR Rule requires that a minimum of eight independent groundwater samples from each background and downgradient well associated with a CCR unit be collected and analyzed for the constituents listed in Appendix III and IV to Part 257 no later than October 17, 2017. This report presents a

summary of the sampling and analytical activities performed to establish background groundwater quality at the Site.

1.1 Description of Ash Pond Area

The WAP, EAP, and New Scrubber Pond (collectively referred to as the “Ash Ponds”) are located immediately east of the MLSES power units (Figure 2). The WAP and EAP receive fluids from bottom ash dewatering bins and other MLSES process wastewater sources that typically include bottom ash fines. Solids present in these wastewaters settle within the ponds and are periodically dredged, dewatered, and transported to the A1 Area Landfill for disposal. The New Scrubber Pond is the primary impoundment used for recycling process wastewater from the flue-gas desulfurization (FGD) process at the MLSES. Solids present in the FGD wastewater settle within the pond and are periodically removed and managed similar to the ash solids from the WAP and EAP.

1.2 Ash Pond Area Groundwater Monitoring System

The CCR groundwater monitoring system at the Ash Pond Area consists of the following eight monitoring wells:

Upgradient Wells	Downgradient Wells
H-26	H-28
H-27	H-29
H-33	H-30
	H-31
	H-32

The CCR monitoring well locations are shown on Figure 2 and groundwater potentiometric surface maps of the Ash Pond Area from the background monitoring period are presented in Appendix A. The CCR groundwater monitoring system was certified by a professional engineer in accordance with 40 C.F.R § 257.91 of the CCR Rule (PBW, 2017).

2.0 BACKGROUND GROUNDWATER MONITORING PROGRAM

This section describes groundwater sampling and analysis procedures used in the background monitoring program.

2.1 Groundwater Sampling Procedures

Background groundwater sampling was performed from October 2015 to December 2016 in accordance with the Site Groundwater Monitoring Plan-Revision 2 (WSP Golder, 2022a). Water levels were measured in each well to the nearest 0.01-foot prior to purging or sampling the wells. The wells were purged using low-flow methods until field water quality parameters stabilized, after which a groundwater sample was collected in a laboratory-supplied container. After the samples were collected, the sample containers were placed in a cooler or similar container, preserved with ice, and delivered to the laboratory for analysis.

2.2 Analytes and Analytical Procedures

Groundwater samples collected during the background monitoring period were analyzed for the constituents listed in Appendix III and IV to Part 257, including:

Appendix III Constituents	Appendix IV Constituents
Boron	Arsenic
Calcium	Barium
Chloride	Beryllium
Fluoride	Cadmium
pH	Chromium
Sulfate	Cobalt
Total Dissolved Solids (TDS)	Fluoride
	Lead
	Lithium
	Mercury
	Molybdenum
	Selenium
	Thallium
	Radium 226 and 228 (combined)

The laboratory methods used to analyze the Appendix III and IV constituents were as follows:

Appendix III Constituents

- Boron and calcium by USEPA Method SW6020;
- Chloride, fluoride, and sulfate by USEPA Method E300;
- pH by Standard Method M4500-H + B (field measurement); and
- TDS by Standard Method M2540.

Appendix IV Constituents

- Antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, lead, lithium, molybdenum, selenium, and thallium by USEPA Method SW6020;
- Fluoride USEPA Method E300;
- Mercury by USEPA Method SW7470; and
- Radium 226 and 228 by USEPA Methods 904.0/SW9320 Modified and 903.1 Modified.

All metals analyses were reported as “total recoverable metals” in accordance with 40 C.F.R § 257.93(1) of the CCR Rule. Samples were not filtered prior to analysis.

2.3 Background Groundwater Monitoring Sampling Results

Eight background groundwater monitoring events were performed using the monitoring well system from October 2015 to December 2016. The laboratory analytical reports for the background samples are presented in Appendix B and the background sample data are summarized in Appendix C, Table C-1 (Appendix III) and Table C-2 (Appendix IV).

2.4 Establishing Background Assessment Levels

The following statistical evaluation approach was selected to develop background groundwater quality assessment levels for the Site:

- Use of interwell data evaluations, which compare new sample data to data from upgradient or background monitoring wells.

- Use of upper prediction limits (UPLs) to develop site-specific background concentrations for all Appendix III and Appendix IV constituents. This approach is a common statistical method used to evaluate groundwater compliance for Subtitle D landfill facilities and is one of the approved options for groundwater quality data statistical evaluations under the CCR Rule.

Documentation on the statistical procedures used to establish background UPLs is presented in Appendix C.

3.0 DETECTION AND ASSESSMENT MONITORING DATA EVALUATION PROCEDURES

Statistical analysis of groundwater monitoring data is required as part of detection monitoring and assessment monitoring under 40 C.F.R § 257.93 of the CCR Rule, and as adopted by the state of Texas at 30 T.A.C. § 352.931. The CCR Rule provides several options for statistically evaluating groundwater data. The owner or operator of the CCR unit must select one of the following statistical methods specified in paragraphs (f)(1) through (5) of 40 C.F.R § 257.93 to evaluate groundwater monitoring data for each specified constituent:

(1) A parametric analysis of variance followed by multiple comparison procedures to identify statistically significant evidence of contamination. The method must include estimation and testing of the contrasts between each compliance well's mean and the background mean levels for each constituent.

(2) An analysis of variance based on ranks followed by multiple comparison procedures to identify statistically significant evidence of contamination. The method must include estimation and testing of the contrasts between each compliance well's median and the background median levels for each constituent.

(3) A tolerance or prediction interval procedure, in which an interval for each constituent is established from the distribution of the background data and the level of each constituent in each compliance well is compared to the upper tolerance or prediction limit.

(4) A control chart approach that gives control limits for each constituent.

(5) Another statistical test method that meets the performance standards of paragraph (g) of this section.

The following statistical evaluation approaches were selected to demonstrate groundwater compliance for the Ash Pond Area under the CCR Rule:

- Use of interwell data evaluations, which compare new sample data to data from upgradient or background monitoring wells.
- Use of UPLs to develop site-specific background concentrations for all Appendix III and Appendix IV constituents. This approach is a common statistical method used to evaluate groundwater compliance for Subtitle D landfill facilities and is one of the approved options for groundwater quality data statistical evaluations under the CCR Rule.
- After every detection monitoring event, Appendix III constituent concentrations from each well are compared to background UPLs to ascertain if a statistically significant increase above background exists. Background UPLs are based on a 1-of-2 resampling

approach, meaning that if one or more constituent concentrations in a compliance well are above their respective background concentration, a resample can be collected to validate or invalidate the background concentration exceedance.

- If in assessment monitoring, the 95% lower confidence limit of the mean (LCL) is calculated after each assessment monitoring event for each Appendix IV constituent. The data set used to calculate LCLs is based on current and historical constituent concentrations. A statistically significant increase over the Groundwater Protection Standard (GWPS) has occurred at a CCR unit when the LCL for at least one assessment monitoring constituent at a well is greater than the appropriate GWPS. Development of the GWPSs is discussed in Section 3.2 and statistical procedures used to develop LCLs are discussed in Appendix C.

The selected statistical evaluation procedures conform with the CCR Rule requirements, as well as the Statistical Analysis Plan for the Site (WSP Golder, 2022b), USEPA's *Unified Guidance: Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities* (USEPA, 2009), and the American Society for Testing and Materials (ASTM) standard D6312-17, *Developing Appropriate Statistical Approaches for Groundwater Detection Monitoring Programs at waste Disposal Facilities* (ASTM, 2017).

3.1 Detection Monitoring Data Evaluation

Background UPLs are based on a 1-of-2 resampling approach, meaning that if zero or one concentration measurements from a series of two independent samples collected from a well do not exceed the appropriate UPL, then a statistically significant increase over background has not occurred at the CCR unit. This conclusion will be reached if the data indicate either of the following:

- All detection monitoring constituent concentrations in a compliance well are less than or equal to their respective background UPL; or

- At least one detection monitoring constituent concentration in a well is above the respective background UPL. If this occurs, the well or wells with constituent concentration(s) above the background UPL(s) may be resampled and analyzed for the detection monitoring constituent(s) with exceedances. If the resample indicates that the target detection monitoring constituent concentration(s) in the well or wells is less than or equal to their respective background UPL(s), then it can be concluded that a statistically significant increase over background for all detection monitoring constituents has not occurred since concentrations in one sample of the two independent samples do not exceed the appropriate background UPL(s).

If the groundwater monitoring data indicate that a statistically significant increase over background has not occurred at the CCR wells, then detection monitoring at all CCR wells will

continue on a semi-annual basis.

If one or more detection monitoring constituent concentration in any well is above the respective background UPL in both the original detection monitoring sample and the resample, then a statistically significant increase over background for the target detection monitoring constituents can be concluded. In accordance with 40 C.F.R. § 257.94(e), if a statistically significant increase is indicated, within 90 days the owner/operator shall:

- Establish an assessment monitoring program, or
- Demonstrate that a source other than the CCR unit caused the statistically significant increase over the background UPL for a constituent, or that the statistically significant increase resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality. Per 30 TAC § 352.941, in making an alternative source demonstration, the owner or operator must:
    - Notify the TCEQ executive director, and any local pollution agency with jurisdiction that has requested to be notified, in writing within 14 days that the owner or operator intends to make an alternative source demonstration; and
    - Within 90 days of making a determination of a statistically significant increase over the background value for any Appendix III constituent, submit a report prepared and certified in accordance with 30 TAC § 352.4 (relating to Engineering and Geoscientific Information) to the TCEQ executive director and any local pollution agency with jurisdiction that has requested to be notified, demonstrating that a source other than a CCR unit caused the statistically significant increase or that the statistically significant increase resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality.

The Appendix III detection monitoring prediction limits are summarized in Table 1. Documentation on the statistical procedures used to establish background groundwater quality prediction limits is presented in Appendix C.

3.2 Assessment Monitoring Data Evaluation

Assessment monitoring will be performed at a CCR unit's groundwater monitoring system after a statistically significant increase over background has been confirmed for one or more of the detection monitoring constituents and the statistically significant increase cannot be attributed to a source other than the CCR unit. Within 90 days of obtaining the results from the initial assessment monitoring sampling event, GWPSs will be established for all Appendix IV assessment monitoring constituents as follows:

- For constituents for which an MCL has been established, the GWPS is the highest of the MCL, UPL, or laboratory reporting limit for each constituent; or

- For constituents for which an MCL has not been established, the GWPS is the higher of the UPL, laboratory reporting limit, or alternative GWPS (as applicable for cobalt, lead, lithium, and molybdenum).

The GWPS for each Appendix IV constituent is presented in Table 2.

The 95% LCL for each Appendix IV constituent concentration for each well is compared to the GWPS established for the constituent to ascertain if a statistically significant increase above the GWPS does or does not exist. A statistically significant increase is indicated if the LCL exceeds the GWPS. Additional information on the development of Appendix IV constituent LCLs is provided in Appendix C.

In accordance with 40 C.F.R. § 257.95(g)(3), if a statistically significant increase over GWPSs for any Appendix IV assessment monitoring constituent is confirmed, within 90 days of the initial assessment monitoring event, the owner/operator will either:

- Initiate an assessment of corrective measures for the CCR unit in accordance with 40 C.F.R. § 257.96; or

- Demonstrate that a source other than the CCR unit caused the statistically significant level over the background UPL for a constituent, or that the statistically significant increase resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality. Per 30 TAC § 352.951, in making an alternative source demonstration, the owner or operator must:

    - Notify the TCEQ executive director, and any local pollution agency with jurisdiction that has requested to be notified, in writing within 14 days that the owner or operator intends to make an alternative source demonstration; and

    - Within 90 days of making a determination of a statistically significant increase over the GWPS of any Appendix IV constituent, submit a report prepared and certified in accordance with 30 TAC § 352.4 (relating to Engineering and Geoscientific Information) to the TCEQ executive director, and any local pollution agency with jurisdiction that has requested to be notified, demonstrating that a source other than a CCR unit caused the exceedance or that the exceedance resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality.

If one or more Appendix IV assessment monitoring constituents are detected at statistically significant levels above their respective GWPS in any sampling event, and if a source other than

the CCR unit cannot be demonstrated to have caused the exceedance, the nature and extent of the release should be further characterized as follows in accordance with 40 C.F.R § 257.95(g)(1):

- Install additional monitoring wells necessary to define the contaminant plume(s);
- Collect data on the nature and estimated quantity of material released including specific information on the Appendix IV assessment monitoring constituents and the levels at which they are present in the material released;
- Install at least one additional monitoring well at the facility boundary in the direction of contaminant migration and sample this well for all Appendix III detection monitoring parameters and for those Appendix IV assessment monitoring constituents that have been detected as part of assessment monitoring. This monitoring must be performed on at least a semi-annual basis thereafter; and
- Sample all wells in accordance with 40 C.F.R § 257.95(d)(1) to characterize the nature and extent of the release.

RE: Luminant - Martin Lake

Dear Will Vienne:

DHL Analytical, Inc. received 16 sample(s) on 10/23/2015 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAC except where noted in the Case Narrative. All non-NELAC methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

Subject: CCR Appendix III and IV
Follow Up Flag: Follow up
Flag Status: Completed

Hi John,

Here are the Appendix III and Appendix IV constituents that we will need to have analyzed under the CCR Rule.

Appendix III
Boron
Calcium
Chloride
Fluoride
pH
sulfate
TDS

Appendix IV
Antimony
Arsenic
Barium
Beryllium
Cadmium
Chromium
Cobalt
Fluoride
Lead
Lithium
Mercury
Molybdenum
Selenium
Thallium
Radium 226 and 228

We are looking to have approximately 74 wells sampled 8 times over the course of the next two years. Please let me know if there is any more information you might need.

Cheers,

Sara

CLIENT: Pastor, Behling & Wheeler
Project: Luminant - Martin Lake
Lab Order: 1510216

CASE NARRATIVE

Samples were analyzed using the methods outlined in the following references:

Method SW6020A - Metals Analysis
Method SW7470A - Mercury Analysis
Method E300 - Anions Analysis
Method M4500-H+ B - pH of a Water Analysis
Method M2540C - TDS Analysis

LOG IN

The samples were received and log-in performed on 10/23/15. A total of 16 samples were received. The samples arrived in good condition and were properly packaged.

METALS ANALYSIS

For Metals analysis performed on 11/5/15 Chromium and Molybdenum were detected above the reporting limits in the method blank (MB-72051). All associated samples were below detection limits for these analytes. No further corrective actions were taken.

For Metals analysis performed on 11/5/15 (batch 72051) the matrix spike duplicate recovery was slightly above control limits for Boron and Calcium. These are flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was from this work order. The LCS was within control limits for these analytes. No further corrective actions were taken.

For Metals analysis performed on 11/9/15 (batch 72217) the RPD for the serial dilution was above control limits for Chromium. This is flagged accordingly. The PDS was within control limits for this analyte. No further corrective actions were taken.

For Metals analysis performed on 11/5/15 and 11/9/15 four LCVLs were above control limits for Boron. These are flagged accordingly. The associated CCVs were within control limits for this analyte. No further corrective actions were taken.

ANIONS ANALYSIS

For Anions analysis performed on 11/2/15 the matrix spike duplicate recoveries (1510216-02 MSD & 1510216-07 MSD) were slightly above control limits for Sulfate. These are flagged accordingly in the QC summary report. The samples selected for the matrix spikes and matrix spike duplicates were from this work order. The LCS was within control limits for this analyte. No further corrective actions were taken.

Re: Routine Analysis
Work Order: 384150
SDG: 1510216

Dear Mr. DuPont:

GEL Laboratories, LLC (GEL) appreciates the opportunity to provide the enclosed analytical results for the sample(s) we received on October 28, 2015. This original data report has been prepared and reviewed in accordance with GEL's standard operating procedures.

Our policy is to provide high quality, personalized analytical services to enable you to meet your analytical needs on time every time. We trust that you will find everything in order and to your satisfaction. If you have any questions, please do not hesitate to call me at (843) 556-8171, ext. 4707.

Sincerely,

Anna C Day

Anna Day

Certificate of Analysis Report
for

DHLA002 DHL Analytical

Client SDG: 1510216 GEL Work Order: 384150

The Qualifiers in this report are defined as follows:

* A quality control analyte recovery is outside of specified acceptance criteria

** Analyte is a Tracer compound

** Analyte is a surrogate compound

U Analyte was analyzed for, but not detected above the MDL, MDA, or LOD.

Where the analytical method has been performed under NELAP certification, the analysis has met all of the requirements of the NELAC standard unless qualified on the Certificate of Analysis.

The designation ND, if present, appears in the result column when the analyte concentration is not detected above the limit as defined in the 'U' qualifier above.

This data report has been prepared and reviewed in accordance with GEL Laboratories LLC standard operating procedures. Please direct any questions to your Project Manager, Anna Day.

SAMPLE RECEIPT & REVIEW FORM

Client: PHILA			**SDG/AR/COC/Work Order:** 384150	
Received By: H. Taylor			**Date Received:** 102815 0920	
Suspected Hazard Information	**Yes**	**No**	*If Net Counts > 100cpm on samples not marked "radioactive", contact the Radiation Safety Group for further investigation.	
COC/Samples marked as radioactive?		✓	Maximum Net Counts Observed* (Observed Counts - Area Background Counts): CCPM	
Classified Radioactive II or III by RSO?		✓	If yes, Were swipes taken of sample containers < action levels?	
COC/Samples marked containing PCBs?		✓		
Package, COC, and/or Samples marked as beryllium or asbestos containing?		✓	If yes, samples are to be segregated as Safety Controlled Samples, and opened by the GEL Safety Group.	
Shipped as a DOT Hazardous?		✓	Hazard Class Shipped: UN#:	
Samples identified as Foreign Soil?		✓		

	Sample Receipt Criteria	Yes	NA	No	Comments/Qualifiers (Required for Non-Conforming Items)
1	Shipping containers received intact and sealed?	✓			Circle Applicable: Seals broken Damaged container Leaking container Other (describe)
2	Samples requiring cold preservation within (0 ≤ 6 deg. C)?*			✓	Preservation Method: Ice bags Blue ice Dry ice None Other (describe) *all temperatures are recorded in Celsius
2a	Daily check performed and passed on IR temperature gun?	✓			Temperature Device Serial #: ES03201330 Secondary Temperature Device Serial # (If Applicable):
3	Chain of custody documents included with shipment?	✓			
4	Sample containers intact and sealed?	✓			Circle Applicable: Seals broken Damaged container Leaking container Other (describe)
5	Samples requiring chemical preservation at proper pH?	✓			Sample ID's, containers affected and observed pH: If Preservation added, Lot#:
6	Do Low Level Perchlorate samples have headspace as required?			✓	Sample ID's and containers affected:
7	VOA vials contain acid preservation?			✓	(If unknown, select No)
8	VOA vials free of headspace (defined as < 6mm bubble)?			✓	Sample ID's and containers affected:
9	Are Encore containers present?			✓	(If yes, immediately deliver to Volatiles laboratory)
10	Samples received within holding time?	✓			ID's and tests affected:
11	Sample ID's on COC match ID's on bottles?	✓			Sample ID's and containers affected:
12	Date & time on COC match date & time on bottles?	✓			Sample ID's affected:
13	Number of containers received match number indicated on COC?	✓			Sample ID's affected:
14	Are sample containers identifiable as GEL provided?			✓	
15	COC form is properly signed in relinquished/received sections?	✓			
16	Carrier and tracking number.				Circle Applicable: FedEx Air FedEx Ground UPS Field Services Courier Other 7748 1199 6914

Notes:

Counting Uncertainty is calculated at the 95% confidence level (1.96-sigma).

The Qualifiers in this report are defined as follows:

**	Analyte is a Tracer compound
<	Result is less than value reported
>	Result is greater than value reported
BD	Results are either below the MDC or tracer recovery is low
FA	Failed analysis.
H	Analytical holding time was exceeded
J	Value is estimated
K	Analyte present. Reported value may be biased high. Actual value is expected to be lower.
L	Analyte present. Reported value may be biased low. Actual value is expected to be higher.
M	M if above MDC and less than LLD
M	REMP Result > MDC/CL and < RDL
N/A	RPD or %Recovery limits do not apply.

QC Summary

Workorder: **384150**

Parmname	NOM	Sample	Qual	QC	Units	RPD%	REC%	Range	Anlst	Date	Time

N1	See case narrative
ND	Analyte concentration is not detected above the detection limit
NJ	Consult Case Narrative, Data Summary package, or Project Manager concerning this qualifier
Q	One or more quality control criteria have not been met. Refer to the applicable narrative or DER.
R	Sample results are rejected
U	Analyte was analyzed for, but not detected above the MDL, MDA, or LOD.
UI	Gamma Spectroscopy--Uncertain identification
UJ	Gamma Spectroscopy--Uncertain identification
UL	Not considered detected. The associated number is the reported concentration, which may be inaccurate due to a low bias.
X	Consult Case Narrative, Data Summary package, or Project Manager concerning this qualifier
Y	Other specific qualifiers were required to properly define the results. Consult case narrative.
^	RPD of sample and duplicate evaluated using +/-RL. Concentrations are <5X the RL. Qualifier Not Applicable for Radiochemistry.
h	Preparation or preservation holding time was exceeded

N/A indicates that spike recovery limits do not apply when sample concentration exceeds spike conc. by a factor of 4 or more or %RPD not applicable.
^ The Relative Percent Difference (RPD) obtained from the sample duplicate (DUP) is evaluated against the acceptance criteria when the sample is greater than five times (5X) the contract required detection limit (RL). In cases where either the sample or duplicate value is less than 5X the RL, a control limit of +/- the RL is used to evaluate the DUP result.
* Indicates that a Quality Control parameter was not within specifications.
For PS, PSD, and SDILT results, the values listed are the measured amounts, not final concentrations.

Where the analytical method has been performed under NELAP certification, the analysis has met all of the requirements of the NELAC standard unless qualified on the QC Summary.

RE: Luminant - Martin Lake

Dear Will Vienne:

DHL Analytical, Inc. received 17 sample(s) on 12/17/2015 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAC except where noted in the Case Narrative. All non-NELAC methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-15-15

Subject: CCR Appendix III and IV
Follow Up Flag: Follow up
Flag Status: Completed

Hi John,

Here are the Appendix III and Appendix IV constituents that we will need to have analyzed under the CCR Rule.

Appendix III
Boron
Calcium
Chloride
Fluoride
pH
sulfate
TDS

Appendix IV
Antimony
Arsenic
Barium
Beryllium
Cadmium
Chromium
Cobalt
Fluoride
Lead
Lithium
Mercury
Molybdenum
Selenium
Thallium
Radium 226 and 228

We are looking to have approximately 74 wells sampled 8 times over the course of the next two years. Please let me know if there is any more information you might need.

Cheers,

Sara

CASE NARRATIVE

Samples were analyzed using the methods outlined in the following references:

Method SW6020A - Metals Analysis
Method SW7470A - Mercury Analysis
Method E300 - Anions Analysis
Method M4500-H+ B - pH of a Water Analysis
Method M2540C - TDS Analysis
Sub-contract - Radium-228 and Radium-226 analyses by methods E904.0/SW8469320 Modified and E903.1 Modified. Analyzed at GEL Laboratory.

LOG IN

The samples were received and log-in performed on 12/17/15. A total of 17 samples were received. The samples arrived in good condition and were properly packaged.

METALS ANALYSIS

For Metals analysis performed on 1/7/16 Boron was detected below the reporting limit in the method blank (MB-72946). All samples were may be biased high for this analyte. No further corrective actions were taken.

For Metals analysis performed on 1/5/16 the matrix spike and matrix spike duplicate recoveries were out of control limits for Calcium. These are flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was from this work order. The LCS was within control limits for this analyte. No further corrective actions were taken.

Re: Routine Analysis
Work Order: 387924
SDG: 1512236

Dear Mr. DuPont:

GEL Laboratories, LLC (GEL) appreciates the opportunity to provide the enclosed analytical results for the sample(s) we received on December 22, 2015. This original data report has been prepared and reviewed in accordance with GEL's standard operating procedures.

Our policy is to provide high quality, personalized analytical services to enable you to meet your analytical needs on time every time. We trust that you will find everything in order and to your satisfaction. If you have any questions, please do not hesitate to call me at (843) 556-8171, ext. 4707.

Sincerely,

Anna C Day

Certificate of Analysis Report
for

DHLA002 DHL Analytical

Client SDG: 1512236 GEL Work Order: 387924

The Qualifiers in this report are defined as follows:

* A quality control analyte recovery is outside of specified acceptance criteria

** Analyte is a Tracer compound

** Analyte is a surrogate compound

U Analyte was analyzed for, but not detected above the MDL, MDA, MDC or LOD.

Where the analytical method has been performed under NELAP certification, the analysis has met all of the requirements of the NELAC standard unless qualified on the Certificate of Analysis.

The designation ND, if present, appears in the result column when the analyte concentration is not detected above the limit as defined in the 'U' qualifier above.

This data report has been prepared and reviewed in accordance with GEL Laboratories LLC standard operating procedures. Please direct any questions to your Project Manager, Anna Day.

	Uncertainty	+/-0.358		+/-3.57						

Notes:

Counting Uncertainty is calculated at the 95% confidence level (1.96-sigma).

The Qualifiers in this report are defined as follows:

**	Analyte is a Tracer compound
<	Result is less than value reported
>	Result is greater than value reported
BD	Results are either below the MDC or tracer recovery is low
FA	Failed analysis.
H	Analytical holding time was exceeded
J	Value is estimated
K	Analyte present. Reported value may be biased high. Actual value is expected to be lower.
L	Analyte present. Reported value may be biased low. Actual value is expected to be higher.
M	M if above MDC and less than LLD
M	REMP Result > MDC/CL and < RDL
N/A	RPD or %Recovery limits do not apply.

QC Summary

Workorder: **387924**

Parmname	NOM	Sample	Qual	QC	Units	RPD%	REC%	Range	Anlst	Date	Time

N1	See case narrative
ND	Analyte concentration is not detected above the detection limit
NJ	Consult Case Narrative, Data Summary package, or Project Manager concerning this qualifier
Q	One or more quality control criteria have not been met. Refer to the applicable narrative or DER.
R	Sample results are rejected
U	Analyte was analyzed for, but not detected above the MDL, MDA, MDC or LOD.
UI	Gamma Spectroscopy--Uncertain identification
UJ	Gamma Spectroscopy--Uncertain identification
UL	Not considered detected. The associated number is the reported concentration, which may be inaccurate due to a low bias.
X	Consult Case Narrative, Data Summary package, or Project Manager concerning this qualifier
Y	Other specific qualifiers were required to properly define the results. Consult case narrative.
^	RPD of sample and duplicate evaluated using +/-RL. Concentrations are <5X the RL. Qualifier Not Applicable for Radiochemistry.
h	Preparation or preservation holding time was exceeded

N/A indicates that spike recovery limits do not apply when sample concentration exceeds spike conc. by a factor of 4 or more or %RPD not applicable.
^ The Relative Percent Difference (RPD) obtained from the sample duplicate (DUP) is evaluated against the acceptance criteria when the sample is greater than five times (5X) the contract required detection limit (RL). In cases where either the sample or duplicate value is less than 5X the RL, a control limit of +/- the RL is used to evaluate the DUP result.
* Indicates that a Quality Control parameter was not within specifications.
For PS, PSD, and SDILT results, the values listed are the measured amounts, not final concentrations.

Where the analytical method has been performed under NELAP certification, the analysis has met all of the requirements of the NELAC standard unless qualified on the QC Summary.

There are no "Data Exception Reports" associated with this analytical report.

SAMPLE RECEIPT & REVIEW FORM

Client: DHLA	SDG/AR/COC/Work Order: 387924
Received By: Brielle Luthman	Date Received: 12/22/15 0850

Suspected Hazard Information	Yes	No	*If Net Counts > 100cpm on samples not marked "radioactive", contact the Radiation Safety Group for further investigation.
COC/Samples marked as radioactive?		✓	Maximum Net Counts Observed* (Observed Counts - Area Background Counts): 0
Classified Radioactive II or III by RSO?		✓	If yes, Were swipes taken of sample containers < action levels?
COC/Samples marked containing PCBs?		✓	
Package, COC, and/or Samples marked as beryllium or asbestos containing?		✓	If yes, samples are to be segregated as Safety Controlled Samples, and opened by the GEL Safety Group.
Shipped as a DOT Hazardous?		✓	Hazard Class Shipped: UN#:
Samples identified as Foreign Soil?		✓	

	Sample Receipt Criteria	Yes	NA	No	Comments/Qualifiers (Required for Non-Conforming Items)
1	Shipping containers received intact and sealed?	✓			Circle Applicable: Seals broken Damaged container Leaking container Other (describe)
2	Samples requiring cold preservation within (0 ≤ 6 deg. C)?*		✓		Preservation Method: Ice bags Blue ice Dry ice (None) Other (describe) *all temperatures are recorded in Celsius 18°
2a	Daily check performed and passed on IR temperature gun?	✓			Temperature Device Serial #: Secondary Temperature Device Serial # (If Applicable): ES032015830
3	Chain of custody documents included with shipment?	✓			
4	Sample containers intact and sealed?	✓			Circle Applicable: Seals broken Damaged container Leaking container Other (describe)
5	Samples requiring chemical preservation at proper pH?	✓			Sample ID's, containers affected and observed pH: If Preservation added, Lot#:
6	Do Low Level Perchlorate samples have headspace as required?		✓		Sample ID's and containers affected:
7	VOA vials contain acid preservation?		✓		(If unknown, select No)
8	VOA vials free of headspace (defined as < 6mm bubble)?		✓		Sample ID's and containers affected:
9	Are Encore containers present?			✓	(If yes, immediately deliver to Volatiles laboratory)
10	Samples received within holding time?	✓			ID's and tests affected:
11	Sample ID's on COC match ID's on bottles?	✓			Sample ID's and containers affected:
12	Date & time on COC match date & time on bottles?	✓			Sample ID's affected:
13	Number of containers received match number indicated on COC?	✓			Sample ID's affected:
14	Are sample containers identifiable as GEL provided?			✓	
15	COC form is properly signed in relinquished/received sections?	✓			
16	Carrier and tracking number.				Circle Applicable: FedEx Air (FedEx Ground) UPS Field Services Courier Other 7752 4483 5086

RE: Luminant - Martin Lake

Dear Will Vienne:

DHL Analytical, Inc. received 17 sample(s) on 2/25/2016 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAC except where noted in the Case Narrative. All non-NELAC methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-15-15

Subject: CCR Appendix III and IV
Follow Up Flag: Follow up
Flag Status: Completed

Hi John,

Here are the Appendix III and Appendix IV constituents that we will need to have analyzed under the CCR Rule.

Appendix III
Boron
Calcium
Chloride
Fluoride
pH
sulfate
TDS

Appendix IV
Antimony
Arsenic
Barium
Beryllium
Cadmium
Chromium
Cobalt
Fluoride
Lead
Lithium
Mercury
Molybdenum
Selenium
Thallium
Radium 226 and 228

We are looking to have approximately 74 wells sampled 8 times over the course of the next two years. Please let me know if there is any more information you might need.

Cheers,

Sara

Lab Order: 1602269

CASE NARRATIVE

Samples were analyzed using the methods outlined in the following references:

Method SW6020A - Metals Analysis
Method SW7470A - Mercury Analysis
Method E300 - Anions Analysis
Method M4500-H+ B - pH of a Water Analysis
Method M2540C - TDS Analysis
Sub-contract - Radium-228 and Radium-226 analyses by methods E904.0/SW8469320 Modified and E903.1 Modified. Analyzed at GEL Laboratory.

LOG IN

The samples were received and log-in performed on 2/25/16. A total of 17 samples were received. The samples arrived in good condition and were properly packaged.

METALS ANALYSIS

For Metals analysis performed on 3/7/16 (batches 73869 & 73881) Boron was detected below the reporting limit in the method blanks (MB-73869 & 73878). All associated samples may be biased high for this analyte. No further corrective actions were taken.

For Metals analysis performed on 3/7/16 (batch 73869) the matrix spike and matrix spike duplicate recoveries were above control limits for Boron. These are flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was not from this work order. The LCS was within control limits for this analyte. No further corrective actions were taken.

For Metals analysis performed on 3/4/16 (batch 73869) the RPD for the serial dilution was above control limits for Lead. This is flagged accordingly. The PDS was within control limits for this analyte. No further corrective actions were taken.

For Metals analysis performed on 3/3/16 (batch 73881) the PDS recovery was slightly below control limits for Calcium. This is flagged accordingly. The serial dilution was within control limits for this analyte. No further corrective actions were taken.

MERCURY ANALYSIS

For Mercury analysis performed on 3/8/16 (batch 73953) the LCS/LCSD had the RPD slightly above control limits. This is flagged accordingly in the QC summary report. The percent recoveries were within control limits. No further corrective actions were taken.

ANIONS ANALYSIS

For Anions analysis performed on 3/3/16 (batch 73960) the matrix spike and matrix spike duplicate recoveries (1602269-01 MS/MSD) were slightly above control limits for Sulfate. These are flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was from this work order. The LCS was within control limits for this analyte. No further corrective actions were taken.

TDS ANALYSIS

For TDS analysis performed on 2/26/16 (batch 73878) TDS was detected below the reporting limit in the method blank (MB-73878). All associated samples were detected greater than 10 times the amount in the blank. No further corrective actions were taken.

Re: Routine Analysis
Work Order: 392232
SDG: 1602269

Dear Mr. DuPont:

GEL Laboratories, LLC (GEL) appreciates the opportunity to provide the enclosed analytical results for the sample(s) we received on March 01, 2016. This original data report has been prepared and reviewed in accordance with GEL's standard operating procedures.

Our policy is to provide high quality, personalized analytical services to enable you to meet your analytical needs on time every time. We trust that you will find everything in order and to your satisfaction. If you have any questions, please do not hesitate to call me at (843) 556-8171, ext. 4707.

Sincerely,

Hope Taylor for
Anna Day
Project Manager

Certificate of Analysis Report
for

DHLA002 DHL Analytical

Client SDG: 1602269 GEL Work Order: 392232

The Qualifiers in this report are defined as follows:

* A quality control analyte recovery is outside of specified acceptance criteria

** Analyte is a Tracer compound

** Analyte is a surrogate compound

U Analyte was analyzed for, but not detected above the MDL, MDA, MDC or LOD.

Where the analytical method has been performed under NELAP certification, the analysis has met all of the requirements of the NELAC standard unless qualified on the Certificate of Analysis.

The designation ND, if present, appears in the result column when the analyte concentration is not detected above the limit as defined in the 'U' qualifier above.

This data report has been prepared and reviewed in accordance with GEL Laboratories LLC standard operating procedures. Please direct any questions to your Project Manager, Anna Day.

	Uncertainty	+/-0.560		+/-7.24						

Notes:

Counting Uncertainty is calculated at the 95% confidence level (1.96-sigma).

The Qualifiers in this report are defined as follows:

**	Analyte is a Tracer compound
<	Result is less than value reported
>	Result is greater than value reported
BD	Results are either below the MDC or tracer recovery is low
FA	Failed analysis.
H	Analytical holding time was exceeded
J	Value is estimated
K	Analyte present. Reported value may be biased high. Actual value is expected to be lower.
L	Analyte present. Reported value may be biased low. Actual value is expected to be higher.
M	M if above MDC and less than LLD
M	REMP Result > MDC/CL and < RDL
N/A	RPD or %Recovery limits do not apply.

QC Summary

Workorder: **392232**

Parmname	NOM	Sample	Qual	QC	Units	RPD%	REC%	Range	Anlst	Date	Time

N1 See case narrative

ND Analyte concentration is not detected above the detection limit

NJ Consult Case Narrative, Data Summary package, or Project Manager concerning this qualifier

Q One or more quality control criteria have not been met. Refer to the applicable narrative or DER.

R Sample results are rejected

U Analyte was analyzed for, but not detected above the MDL, MDA, MDC or LOD.

UI Gamma Spectroscopy--Uncertain identification

UJ Gamma Spectroscopy--Uncertain identification

UL Not considered detected. The associated number is the reported concentration, which may be inaccurate due to a low bias.

X Consult Case Narrative, Data Summary package, or Project Manager concerning this qualifier

Y Other specific qualifiers were required to properly define the results. Consult case narrative.

^ RPD of sample and duplicate evaluated using +/-RL. Concentrations are <5X the RL. Qualifier Not Applicable for Radiochemistry.

h Preparation or preservation holding time was exceeded

N/A indicates that spike recovery limits do not apply when sample concentration exceeds spike conc. by a factor of 4 or more or %RPD not applicable.
^ The Relative Percent Difference (RPD) obtained from the sample duplicate (DUP) is evaluated against the acceptance criteria when the sample is greater than five times (5X) the contract required detection limit (RL). In cases where either the sample or duplicate value is less than 5X the RL, a control limit of +/- the RL is used to evaluate the DUP result.
* Indicates that a Quality Control parameter was not within specifications.
For PS, PSD, and SDILT results, the values listed are the measured amounts, not final concentrations.

Where the analytical method has been performed under NELAP certification, the analysis has met all of the requirements of the NELAC standard unless qualified on the QC Summary.

There are no "Data Exception Reports" associated with this analytical report.

RE: Luminant-Martin Lake

Dear Will Vienne:

DHL Analytical, Inc. received 7 sample(s) on 4/6/2016 for the analyses presented in the following report.

REVISION#1: This revision consists of having the sub-contract laboratory correct the Ra-228 result for sample H-27 as per the client. Please replace the original report with this revised report.

There were no problems with the analyses and all data met requirements of NELAC except where noted in the Case Narrative. All non-NELAC methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-16-16

Subject: CCR Appendix III and IV
Follow Up Flag: Follow up
Flag Status: Completed

Hi John,

Here are the Appendix III and Appendix IV constituents that we will need to have analyzed under the CCR Rule.

Appendix III
Boron
Calcium
Chloride
Fluoride
pH
sulfate
TDS

Appendix IV
Antimony
Arsenic
Barium
Beryllium
Cadmium
Chromium
Cobalt
Fluoride
Lead
Lithium
Mercury
Molybdenum
Selenium
Thallium
Radium 226 and 228

We are looking to have approximately 74 wells sampled 8 times over the course of the next two years. Please let me know if there is any more information you might need.

Cheers,

Sara

DHL Analytical, Inc. **Date:** *09-May-16*

CLIENT: Pastor, Behling & Wheeler
Project: Luminant-Martin Lake
Lab Order: 1604052

CASE NARRATIVE

Samples were analyzed using the methods outlined in the following references:

Method SW6020A - Metals Analysis
Method SW7470A - Mercury Analysis
Method E300 - Anions Analysis
Method M4500-H+ B - pH of a Water Analysis
Method M2540C - TDS Analysis
Sub-contract - Radium-228 and Radium-226 analyses by methods E904*/9320* and SM 7500 Ra B M*. Analyzed at ESC Lab Sciences.

LOG IN

The samples were received and log-in performed on 4/6/16. A total of 7 samples were received. The samples arrived in good condition and were properly packaged.

METALS ANALYSIS

For Metals analysis performed on 4/8/16, 4/11/16 and 4/15/16 (batches 74761 & 74482) the matrix spikes and matrix spike duplicate recoveries were out of control limits for Boron and/or Calcium. These are flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate (batch 74461) was not from this work order. The sample selected for the matrix spike and matrix spike duplicate (batch 74482) was from this work order. The LCSs were within control limits for these analytes. No further corrective actions were taken.

For Metals analysis performed on 4/15/16 (batch 74482) the RPD for the serial dilution was slightly above control limits for Boron. This is flagged accordingly. The PDS was within control limits for this analyte. No further corrective actions were taken.

MERCURY ANALYSIS

For Mercury analysis performed on 4/7/16 the LCS/LCSD had the RPD slightly above control limits. This is flagged accordingly in the QC summary report. The percent recoveries were within control limits. No further corrective actions were taken.

For Mercury analysis performed on 4/7/16 the PDS recovery was slightly below control limits. This is flagged accordingly. The serial dilution was within control limits. No further corrective actions were taken.

Case Narrative

Lab No: 20160335

This report contains the analytical results for the 7 sample(s) received under chain of custody by ESC Lab Sciences on 04/08/16 16:03:50. These samples are associated with your 1604052 project.

The analytical results included in this report meet all applicable quality control procedure requirements except as noted below:

The test results in this report meet all NELAC requirements unless noted below:

This report shall not be reproduced, except in full, without the written approval of ESC Lab Sciences.

All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client.

Results have been reviewed by the Director of Radiochemistry or their designees and is approved for release.

Observations / Nonconformances

The following QC parameters are outside method control limits: Ra226 MSD RPD.
The report was amended on 5/20/16 to correct the Ra-228 result for sample #6. No other changes were made.

RE: Luminant-Martin Lake

Dear Will Vienne:

DHL Analytical, Inc. received 12 sample(s) on 4/7/2016 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAC except where noted in the Case Narrative. All non-NELAC methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-16-16

Subject: CCR Appendix III and IV
Follow Up Flag: Follow up
Flag Status: Completed

Hi John,

Here are the Appendix III and Appendix IV constituents that we will need to have analyzed under the CCR Rule.

Appendix III
Boron
Calcium
Chloride
Fluoride
pH
sulfate
TDS

Appendix IV
Antimony
Arsenic
Barium
Beryllium
Cadmium
Chromium
Cobalt
Fluoride
Lead
Lithium
Mercury
Molybdenum
Selenium
Thallium
Radium 226 and 228

We are looking to have approximately 74 wells sampled 8 times over the course of the next two years. Please let me know if there is any more information you might need.

Cheers,

Sara

Carrier name FedEx 1day

Shipping container/cooler in good condition?	Yes ☑	No ☐	Not Present ☐
Custody seals intact on shippping container/cooler?	Yes ☐	No ☐	Not Present ☑
Custody seals intact on sample bottles?	Yes ☐	No ☐	Not Present ☑
Chain of custody present?	Yes ☑	No ☐	
Chain of custody signed when relinquished and received?	Yes ☑	No ☐	
Chain of custody agrees with sample labels?	Yes ☑	No ☐	
Samples in proper container/bottle?	Yes ☑	No ☐	
Sample containers intact?	Yes ☑	No ☐	
Sufficient sample volume for indicated test?	Yes ☑	No ☐	
All samples received within holding time?	Yes ☑	No ☐	
Container/Temp Blank temperature in compliance?	Yes ☑	No ☐	1.6 °C
Water - VOA vials have zero headspace?	Yes ☐	No ☐	No VOA vials submitted ☑
Water - pH<2 acceptable upon receipt?	Yes ☑	No ☐	NA ☐ LOT # 8086
	Adjusted? no		Checked by JB
Water - ph>9 (S) or ph>12 (CN) acceptable upon receipt?	Yes ☐	No ☐	NA ☑ LOT #
	Adjusted? _____		Checked by _____

CASE NARRATIVE

Samples were analyzed using the methods outlined in the following references:

Method SW6020A - Metals Analysis
Method SW7470A - Mercury Analysis
Method E300 - Anions Analysis
Method M4500-H+ B - pH of a Water Analysis
Method M2540C - TDS Analysis
Sub-contract - Radium-228 and Radium-226 analyses by methods E904/9320 and SM 7500 Ra B M. Analyzed at ESC Lab Sciences.

LOG IN

The samples were received and log-in performed on 4/7/16. A total of 12 samples were received. The samples arrived in good condition and were properly packaged.

METALS ANALYSIS

For Metals analysis performed on 4/11/16, 4/15/16 and 4/20/16 (batches 74482 & 74505) the matrix spikes and/or matrix spike duplicate recoveries were out of control limits for Boron and/or Calcium. These are flagged accordingly in the QC summary report. The samples selected for the matrix spikes and matrix spike duplicates (batches 74482 & 74505) were not from this work order. The LCSs were within control limits for these analytes. No further corrective actions were taken.

For Metals analysis performed on 4/15/16 (batch 74482) the RPD for the serial dilution was slightly above control limits for Boron. This is flagged accordingly. The PDS was within control limits for this analyte. No further corrective actions were taken.

Case Narrative

Lab No: 20160337

This report contains the analytical results for the 12 sample(s) received under chain of custody by ESC Lab Sciences on 04/11/16 14:12:37. These samples are associated with your 16040 project.

The analytical results included in this report meet all applicable quality control procedure requirements except as noted below:

The test results in this report meet all NELAC requirements unless noted below:

This report shall not be reproduced, except in full, without the written approval of ESC Lab Sciences.

All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client.

Results have been reviewed by the Director of Radiochemistry or their designees and is approved for release.

Observations / Nonconformances

The following QC parameters are outside method control limits: Ra226 MSD RPD

RE: Luminant - MLSES

Dear Will Vienne:

DHL Analytical, Inc. received 9 sample(s) on 6/8/2016 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAC except where noted in the Case Narrative. All non-NELAC methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-16-16

To: John Dupont
Subject: CCR Appendix III and IV
Follow Up Flag: Follow up
Flag Status: Completed

Hi John,

Here are the Appendix III and Appendix IV constituents that we will need to have analyzed under the CCR Rule.

Appendix III
Boron
Calcium
Chloride
Fluoride
pH
sulfate
TDS

Appendix IV
Antimony
Arsenic
Barium
Beryllium
Cadmium
Chromium
Cobalt
Fluoride
Lead
Lithium
Mercury
Molybdenum
Selenium
Thallium
Radium 226 and 228

We are looking to have approximately 74 wells sampled 8 times over the course of the next two years. Please let me know if there is any more information you might need.

Cheers,

Sara

CLIENT: Pastor, Behling & Wheeler
Project: Luminant - MLSES
Lab Order: 1606075

CASE NARRATIVE

Samples were analyzed using the methods outlined in the following references:

Method SW6020A - Metals Analysis
Method SW7470A - Mercury Analysis
Method E300 - Anions Analysis
Method M4500-H+ B - pH of a Water Analysis
Method M2540C - TDS Analysis
Sub-contract - Radium-228 and Radium-226 analyses by methods E904/9320 and SM 7500 Ra B M. Analyzed at ESC Lab Sciences.

LOG IN

The samples were received and log-in performed on 6/8/16. A total of 9 samples were received. The samples arrived in good condition and were properly packaged.

METALS ANALYSIS

For Metals analysis performed on 6/10/16 the matrix spike and matrix spike duplicate had the RPD slightly above control limits for Antimony. This is flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was from this work order. The percent recovery was within control limits for this analyte. No further corrective actions were taken.

For Metals analysis performed on 6/14/16 the RPD for the serial dilution was slightly above control limits for Boron. This is flagged accordingly. The PDS was within control limits for this analyte. No further corrective actions were taken.

For Metals analysis performed on 6/10/16 LCVL-160610 was slightly below control limits for Beryllium. This is flagged accordingly. The associated CCV-160610 was within control limits for this analyte. No further corrective actions were taken.

MERCURY ANALYSIS

For Mercury analysis performed on 6/17/16 the matrix spike and matrix spike duplicate recoveries were below control limits. These are flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was from this work order. The LCS was within control limits. No further corrective actions were taken.

For Mercury analysis performed on 6/17/16 the PDS recovery was below control limits. This is flagged accordingly. The serial dilution was within control limits. No further corrective actions were taken.

Case Narrative

Lab No: 20160558

This report contains the analytical results for the 9 sample(s) received under chain of custody by ESC Lab Sciences on 6/10/2016 11:17:04 AM. These samples are associated with your 1606075 project.

The analytical results included in this report meet all applicable quality control procedure requirements except as noted below:

The test results in this report meet all NELAC requirements unless noted below:

This report shall not be reproduced, except in full, without the written approval of ESC Lab Sciences.

All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client.

Results have been reviewed by the Director of Radiochemistry or their designees and is approved for release.

Observations / Nonconformances

OUTREACH LABORATORY, A Divsion of ESC Lab Sciences

RE: Luminant - Martin Lake

Dear Will Vienne:

DHL Analytical, Inc. received 27 sample(s) on 8/11/2016 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAC except where noted in the Case Narrative. All non-NELAC methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-16-16

To:	John Dupont
Subject:	CCR Appendix III and IV
Follow Up Flag:	Follow up
Flag Status:	Completed

Hi John,

Here are the Appendix III and Appendix IV constituents that we will need to have analyzed under the CCR Rule.

Appendix III
Boron
Calcium
Chloride
Fluoride
pH
sulfate
TDS

Appendix IV
Antimony
Arsenic
Barium
Beryllium
Cadmium
Chromium
Cobalt
Fluoride
Lead
Lithium
Mercury
Molybdenum
Selenium
Thallium
Radium 226 and 228

We are looking to have approximately 74 wells sampled 8 times over the course of the next two years. Please let me know if there is any more information you might need.

Cheers,

Sara

Corrective Action _____

Samples were analyzed using the methods outlined in the following references:

Method SW6020A - Metals Analysis
Method SW7470A - Mercury Analysis
Method E300 - Anions Analysis
Method M4500-H+ B - pH of a Water Analysis
Method M2540C - TDS Analysis
Sub-contract - Radium-228 and Radium-226 analyses by methods E904/9320 and SM 7500 Ra B M. Analyzed at ESC Lab Sciences.

LOG IN

The samples were received and log-in performed on 8/11/16. A total of 27 samples were received. The samples arrived in good condition and were properly packaged.

METALS ANALYSIS

For Metals analysis (batch 76817) the matrix spike and matrix spike duplicate had low responses for the internal standard Bismuth. The associated analyte (Lead) was within control limits. No further corrective actions were taken.

For Metals analysis performed on 8/17/16, 8/19/16, 8/22/16, 8/23/16 and 8/24/16 (batches 76816, 76817, 76893 and 76895) the matrix spikes and matrix spike duplicate recoveries were out of control limits for a total of nine analytes. In addition, the matrix spikes and matrix spike duplicates (batches 76893 & 76895) had the RPD slightly above control limits for Boron or Selenium. These are flagged accordingly in the QC summary report. The samples selected for the matrix spikes and matrix spike duplicates were not from this work order. The LCSs were within control limits for these analytes. No further corrective actions were taken.

For Metals analysis performed on 8/22/16 and 8/24/16 (batches 76817 & 76893) the RPDs for the serial dilutions were slightly above control limits for Boron. These are flagged accordingly. The PDSs were within control limits for this analyte. No further corrective actions were taken.

For Metals analysis performed on 8/19/16 and 8/23/16 (batches 76817 & 76893) the PDS recoveries were below control limits for Molybdenum or Lithium. These are flagged accordingly. The serial dilutions were within control limits for these analytes. No further corrective actions were taken.

For Metals analysis performed on 8/18/16 and 8/22/16 LCVL3-160818 and LCVL2-160822 were out of control limits for Boron or Beryllium. These are flagged accordingly. The associated CCV3-160818

and CCV2-160822 were within control limits for these analytes. No further corrective actions were taken.

Total Dissolved Solids (Residue, Filtera	22900	200	0	22720				0.702	5	

Qualifiers:

B	Analyte detected in the associated Method Blank	DF	Dilution Factor
J	Analyte detected between MDL and RL	MDL	Method Detection Limit
ND	Not Detected at the Method Detection Limit	R	RPD outside accepted control limits
RL	Reporting Limit	S	Spike Recovery outside control limits
J	Analyte detected between SDL and RL	N	Parameter not NELAC certified

Case Narrative

Lab No: 20160784

This report contains the analytical results for the 27 sample(s) received under chain of custody by ESC Lab Sciences on 8/16/2016 10:12:00 AM. These samples are associated with your 1608133 project.

The analytical results included in this report meet all applicable quality control procedure requirements except as noted below:

The test results in this report meet all NELAC requirements unless noted below:

This report shall not be reproduced, except in full, without the written approval of ESC Lab Sciences.

All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client.

Results have been reviewed by the Director of Radiochemistry or their designees and is approved for release.

Observations / Nonconformances

RE: MLSES-Ash Pond Area

Dear Will Vienne:

DHL Analytical, Inc. received 8 sample(s) on 10/20/2016 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAC except where noted in the Case Narrative. All non-NELAC methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-16-17

To:	John Dupont
Subject:	CCR Appendix III and IV
Follow Up Flag:	Follow up
Flag Status:	Completed

Hi John,

Here are the Appendix III and Appendix IV constituents that we will need to have analyzed under the CCR Rule.

Appendix III
Boron
Calcium
Chloride
Fluoride
pH
sulfate
TDS

Appendix IV
Antimony
Arsenic
Barium
Beryllium
Cadmium
Chromium
Cobalt
Fluoride
Lead
Lithium
Mercury
Molybdenum
Selenium
Thallium
Radium 226 and 228

We are looking to have approximately 74 wells sampled 8 times over the course of the next two years. Please let me know if there is any more information you might need.

Cheers,

Sara

CASE NARRATIVE

Samples were analyzed using the methods outlined in the following references:

Method SW6020A - Metals Analysis
Method SW7470A - Mercury Analysis
Method E300 - Anions Analysis
Method M4500-H+ B - pH of a Water Analysis
Method M2540C - TDS Analysis
Sub-contract - Radium-228 and Radium-226 analyses by methods E904/9320 and SM 7500 Ra B M. Analyzed at ESC Lab Sciences.

LOG IN

The samples were received and log-in performed on 10/20/16. A total of 8 samples were received. The samples arrived in good condition and were properly packaged.

METALS ANALYSIS

For Metals analysis performed on 10/28/16 the RPD for the serial dilution was slightly above control limits for Boron. This is flagged accordingly in the QC summary report. The PDS was within control limits for this analyte. No further corrective actions were taken.

Case Narrative

Lab No: 20161033

This report contains the analytical results for the 8 sample(s) received under chain of custody by ESC Lab Sciences on 10/24/2016 10:37:23 AM. These samples are associated with your 1610171 project.

The analytical results included in this report meet all applicable quality control procedure requirements except as noted below:

The test results in this report meet all NELAC requirements unless noted below:

This report shall not be reproduced, except in full, without the written approval of ESC Lab Sciences.

All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client.

Results have been reviewed by the Director of Radiochemistry or their designees and is approved for release.

Observations / Nonconformances

L867983

RE: MLSES - Ash Pond Area

Dear Will Vienne:

DHL Analytical, Inc. received 8 sample(s) on 12/13/2016 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAC except where noted in the Case Narrative. All non-NELAC methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-16-17

To: John Dupont
Subject: CCR Appendix III and IV
Follow Up Flag: Follow up
Flag Status: Completed

Hi John,

Here are the Appendix III and Appendix IV constituents that we will need to have analyzed under the CCR Rule.

Appendix III
Boron
Calcium
Chloride
Fluoride
pH
sulfate
TDS

Appendix IV
Antimony
Arsenic
Barium
Beryllium
Cadmium
Chromium
Cobalt
Fluoride
Lead
Lithium
Mercury
Molybdenum
Selenium
Thallium
Radium 226 and 228

We are looking to have approximately 74 wells sampled 8 times over the course of the next two years. Please let me know if there is any more information you might need.

Cheers,

Sara

CASE NARRATIVE

Samples were analyzed using the methods outlined in the following references:

Method SW6020A - Metals Analysis
Method SW7470A - Mercury Analysis
Method E300 - Anions Analysis
Method M4500-H+ B - pH of a Water Analysis
Method M2540C - TDS Analysis
Sub-contract - Radium-228 and Radium-226 analyses by methods E904/9320 and SM 7500 Ra B M. Analyzed at ESC Lab Sciences.

LOG IN

The samples were received and log-in performed on 12/13/16. A total of 8 samples were received. The samples arrived in good condition and were properly packaged.

METALS ANALYSIS

For Metals analysis performed on 12/15/16 the matrix spike and matrix spike duplicate recoveries were out of control limits for Boron and/or Calcium. These are flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was from this work order. The percent recoveries for the LCS were within control limits for these analytes. No further corrective actions were taken.

For Metals analysis performed on 12/16/16 the LCS/LCSD had the RPD slightly above control limits for twelve analytes. These are flagged accordingly. The percent recoveries were within control limits. No further corrective actions were taken.

For Metals analysis performed on 12/20/16 the RPD for the serial dilution was above control limits for Boron. This is flagged accordingly. The PDS was within control limits for this analyte. No further corrective actions were taken.

For Metals analysis performed on 12/15/16 Boron was detected above the reporting limit in CCB8-161215. The associated samples are QC samples only. No further corrective actions were taken.

For Metals analysis performed on 12/15/16 CCV7-161215, LCVL7-161215, CCV8-161215 and LCVL8-16215 were above control limits for Boron. These are flagged accordingly. The associated samples were QC samples only. No further corrective actions were taken.

For Metals analysis performed on 12/16/16 LCVL4-161216 and LCVL5-16216 were out of control

limits for Boron. These are flagged accordingly. The associated CCVs were within control limits for this analyte. No further corrective actions were taken.

Case Narrative

Lab No: 20161233

This report contains the analytical results for the 8 sample(s) received under chain of custody by ESC Lab Sciences on 12/15/2016 12:39:34 PM. These samples are associated with your 1612132 project.

The analytical results included in this report meet all applicable quality control procedure requirements except as noted below:

The test results in this report meet all NELAC requirements unless noted below:

This report shall not be reproduced, except in full, without the written approval of ESC Lab Sciences.

All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client.

Results have been reviewed by the Director of Radiochemistry or their designees and is approved for release.

Observations / Nonconformances

L879328

Data Usability Summary
Luminant – Martin Lake Steam Electric Station
October 20-30, 2015
Groundwater Monitoring Event
DHL Analytical Data Packages 1510216, 1510228, and 1511007

Pastor, Behling & Wheeler, LLC reviewed three data packages from DHL Analytical for the analysis of groundwater samples collected October 20-30, 2015 at the Martin Lake Steam Electric Station in Tatum, Texas. Data were reviewed for adherence to project objectives.

Intended Use of Data: To provide current data on concentrations of chemicals of concern (COCs) in the groundwater at the site.

Analyses requested included:

- Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Lead, Lithium, Molybdenum, Selenium, and Thallium by USEPA Method SW6020A – Metals Analysis;
- Chloride, Fluoride, and Sulfate by USEPA Method E300 – Anion Analysis;
- Mercury by USEPA Method SW7470A – Mercury Analysis;
- pH of Water by Standard Method M4500-H + B – pH of Water Analysis;
- Total Dissolved Solids (TDS) by Standard Method M2540C – TDS Analysis; and
- Radium 226 and 228 by USEPA Methods 904.0/SW846 9320 Modified and 903.1 Modified.

Data were reviewed and validated and the results of the review/validation are discussed in this Data Usability Summary (DUS). The following laboratory submittals and field data were examined:

- the reportable data,
- case narratives, and
- field notes with respect to field instrument calibrations, filtering procedures, sampling procedures, and preservation procedures prior to shipping the samples to the laboratory.

The results of supporting quality control (QC) analyses were summarized in the case narrative, included in this review, with the laboratory data package.

Introduction

Twenty five (25) groundwater samples were analyzed for the constituents listed above (Appendix III and Appendix IV constituents in the Coal Combustion Residuals Federal Rule). Table B-1 lists the field sample identifications cross-referenced to the laboratory identifications.

Project Objectives

Project quality QC objectives were established in conformance to the requirements of *SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods* and *Standard Methods*. Laboratory control sample and sample duplicate recovery QC criteria were 70 – 130% recovery (%R) for metals and inorganics. Laboratory recovery QC criteria were 30% Relative Percent Difference (RPD). Field duplicate recovery QC criteria were 50% RPD.

Data Review / Validation Results

Analytical Results

Non-detected results (ND) are reported as less than the value of the method detection limit (MDL) and received a "U" flag. Analytes detected between the method quantitation limit (MQL) and the MDL were qualified with a "J-flag" to denote that the reported value was considered to be estimated. If a QC result was found outside of the review criteria, the reviewer applied a data qualifier and bias code to the associated sample data if the analyte was detected. Sample data were not qualified if recoveries exceeded QC criteria and the analyte was not detected.

Preservation and Holding Times

Samples were evaluated for agreement with the chain-of-custody (COC). All samples were received in the appropriate containers and in good condition with the paperwork filled out properly. Sample receipt temperatures were within the acceptance criteria of 4 ± 2 °C. Samples were prepared and analyzed within holding times as specified in the analysis methods.

Calibrations

The initial and continuing calibration data met laboratory control limits with the exception of the following:

For Metals analysis performed on 11/5/2015 and 11/9/2015, four LCVLs were above control limits for Boron. These are flagged accordingly. The associated CCVs were within control limits for this analyte. No further corrective actions were taken.

For Metals analysis performed on 11/3/2015, LCVL3-151103 was above control limits for Boron and Calcium. This was due to sample carryover. The affected samples were the matrix spike and matrix spike duplicate. No further corrective actions were taken.

For Metals analysis performed on 11/9/2015, LCVL2-151109 was slightly above control limits for Calcium. This is flagged accordingly. The associated CCV2-151109 was within control limits for this analyte. No further corrective actions were taken.

Blanks

No field blanks were used because the sampling event did not include volatile or semi-volatile compounds.

All laboratory method blank results were reported as non-detected or below applicable assessment levels with the exception of the following:

For Metals analysis performed on 11/5/2015 Chromium and Molybdenum were detected above the reporting limits in the method blank. All associated samples were below detection limits for these analytes. No further corrective actions were taken.

For Metals analysis performed on 11/9/2015 Boron was detected below the reporting limit in the method blank. All samples were detected greater than 10 times the amount in the blank for this analyte. No further corrective actions were taken.

No equipment blank was collected

Internal Standards

For Metals analysis samples BMW-19 and BMW-18 had low responses for the internal standards Indium and Bismuth. All associated analytes (Barium, Cadmium, Molybdenum, and Lead) were not reported from this analytical run and were re-analyzed.

Surrogate Recoveries

The analytical procedures used did not require surrogates; therefore, surrogate recovery is not applicable.

Laboratory Control Samples

Laboratory control sample (LCS) recoveries were within QC acceptance limits for all LCS analyses.

Matrix Spike/Matrix Spike Duplicates

MS/MSD percent recoveries were within acceptable control limits for all samples with the exception of the following:

For Metals analysis performed on 11/3/2015 the matrix spike and matrix spike duplicate recoveries were out of control limits for Calcium, and the matrix spike duplicate recovery was out of control limits for Antimony. In addition, the matrix spike and matrix spike duplicate had the RPD above control limits for Antimony. These are flagged accordingly in the QC summary report. The sample selected for the MS and MSD was not from this work order. The LCS was within control limits for these analytes. No further corrective actions were taken.

For Metals analysis performed on 11/9/2015 the matrix spike and matrix spike duplicate recoveries were out of control limits for Calcium. These are flagged accordingly in the QC summary report. The sample selected for the MS and MSD was not from this work order. The LCS was within control limits for this analyte. No further corrective actions were taken.

For Mercury analysis for lab package 1511007 the matrix spike and matrix spike duplicate was re-prepped and re-analyzed on 11/10/2015. This was due to a prep error. This exceeded the 24 hour prep window.

Serial Dilution/Post Dilution Spike

For Metals analysis performed on 11/9/2015 the RPD for the serial dilution was above control limits for Chromium. This is flagged accordingly. The PDS was within control limits for this analyte. No further corrective actions were taken.

Field Precision

No sample duplicates were taken during this sampling event.

Field Procedures

Groundwater samples were collected using low-flow procedures with a peristaltic, stainless steel submersible pump, or bladder pump and placed in unpreserved 250-ml plastic bottles and 500-ml plastic bottles preserved with HNO_3. Wells were purged until groundwater parameters (temperature, pH, specific conductivity, dissolved oxygen, redox, and turbidity) stabilized to within +/- 10%.

Summary

Groundwater analytical data are usable for the purpose of determining current COC concentrations in the groundwater at the site with no qualifications added as a result of this evaluation.

Data Usability Summary
Luminant – Martin Lake Steam Electric Station
December 14-15, 2015
Groundwater Monitoring Event
DHL Analytical Data Package 1512236

Pastor, Behling & Wheeler, LLC reviewed one data package from DHL Analytical for the analysis of groundwater samples collected December 14-15, 2015 at the Martin Lake Steam Electric Station in Tatum, Texas. Data were reviewed for adherence to project objectives.

Intended Use of Data: To provide current data on concentrations of chemicals of concern (COCs) in the groundwater at the site.

Analyses requested included:

- Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Lead, Lithium, Molybdenum, Selenium, and Thallium by USEPA Method SW6020A – Metals Analysis;
- Chloride, Fluoride, and Sulfate by USEPA Method E300 – Anion Analysis;
- Mercury by USEPA Method SW7470A – Mercury Analysis;
- pH of Water by Standard Method M4500-H + B – pH of Water Analysis;
- Total Dissolved Solids (TDS) by Standard Method M2540C – TDS Analysis; and
- Radium 226 and 228 by USEPA Methods 904.0/SW846 9320 Modified and 903.1 Modified.

Data were reviewed and validated and the results of the review/validation are discussed in this Data Usability Summary (DUS). The following laboratory submittals and field data were examined:

- the reportable data,
- case narratives, and
- field notes with respect to field instrument calibrations, filtering procedures, sampling procedures, and preservation procedures prior to shipping the samples to the laboratory.

The results of supporting quality control (QC) analyses were summarized in the case narrative, included in this review, with the laboratory data package.

Introduction

Seventeen (17) groundwater samples were analyzed for the constituents listed above (Appendix III and Appendix IV constituents in the Coal Combustion Residuals Federal Rule). Table B-1 lists the field sample identifications cross-referenced to the laboratory identifications.

Project Objectives

Project quality QC objectives were established in conformance to the requirements of *SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods* and *Standard Methods*. Laboratory control sample and sample duplicate recovery QC criteria were 70 – 130% recovery (%R) for metals and inorganics. Laboratory recovery QC criteria were 30% Relative Percent Difference (RPD). Field duplicate recovery QC criteria were 50% RPD.

Data Review / Validation Results

Analytical Results

Non-detected results (ND) are reported as less than the value of the method detection limit (MDL) and received a "U" flag. Analytes detected between the method quantitation limit (MQL) and the MDL were qualified with a "J-flag" to denote that the reported value was considered to be estimated. If a QC result was found outside of the review criteria, the reviewer applied a data qualifier and bias code to the associated sample data if the analyte was detected. Sample data were not qualified if recoveries exceeded QC criteria and the analyte was not detected.

Preservation and Holding Times

Samples were evaluated for agreement with the chain-of-custody (COC). All samples were received in the appropriate containers and in good condition with the paperwork filled out properly. Sample receipt temperatures were within the acceptance criteria of 4 ± 2 °C. Samples were prepared and analyzed within holding times as specified in the analysis methods.

Calibrations

The initial and continuing calibration data met laboratory control limits.

Blanks

No field blanks were used because the sampling event did not include volatile or semi-volatile compounds.

All laboratory method blank results were reported as non-detected or below applicable assessment levels with the exception of the following:

For Metals analysis performed on 1/7/2016 Boron was detected below the reporting limit in the method blank. All samples may be biased high for this analyte. No further corrective actions were taken.

No equipment blank was collected

Surrogate Recoveries

The analytical procedures used did not require surrogates; therefore, surrogate recovery is not applicable.

Laboratory Control Samples

Laboratory control sample (LCS) recoveries were within QC acceptance limits for all LCS analyses.

Matrix Spike/Matrix Spike Duplicates

MS/MSD percent recoveries were within acceptable control limits for all samples with the exception of the following:

For Metals analysis performed on 1/5/2016 the matrix spike and matrix spike duplicate recoveries were out of control limits for Calcium. These are flagged accordingly in the QC summary report. The sample selected for the MS and MSD was from this work order. The LCS was within control limits for these analytes. No further corrective actions were taken.

Field Precision

No sample duplicates were taken during this sampling event.

Field Procedures

Groundwater samples were collected using low-flow procedures with a peristaltic, stainless steel submersible pump, or bladder pump and placed in unpreserved 250-ml plastic bottles and 500-ml plastic bottles preserved with HNO_3. Wells were purged until groundwater parameters (temperature, pH, specific conductivity, dissolved oxygen, redox, and turbidity) stabilized to within +/- 10%.

Summary

Groundwater analytical data are usable for the purpose of determining current COC concentrations in the groundwater at the site with no qualifications added as a result of this evaluation.

Data Usability Summary
Luminant – Martin Lake Steam Electric Station
February 23-24, 2016
Groundwater Monitoring Event
DHL Analytical Data Package 1602269

Pastor, Behling & Wheeler, LLC reviewed one data package from DHL Analytical for the analysis of groundwater samples collected February 23-24, 2016 at the Martin Lake Steam Electric Station in Tatum, Texas. Data were reviewed for adherence to project objectives.

Intended Use of Data: To provide current data on concentrations of chemicals of concern (COCs) in the groundwater at the site.

Analyses requested included:

- Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Lead, Lithium, Molybdenum, Selenium, and Thallium by USEPA Method SW6020A – Metals Analysis;
- Chloride, Fluoride, and Sulfate by USEPA Method E300 – Anion Analysis;
- Mercury by USEPA Method SW7470A – Mercury Analysis;
- pH of Water by Standard Method M4500-H + B – pH of Water Analysis;
- Total Dissolved Solids (TDS) by Standard Method M2540C – TDS Analysis; and
- Radium 226 and 228 by USEPA Methods 904.0/SW846 9320 Modified and 903.1 Modified.

Data were reviewed and validated and the results of the review/validation are discussed in this Data Usability Summary (DUS). The following laboratory submittals and field data were examined:

- the reportable data,
- case narratives, and
- field notes with respect to field instrument calibrations, filtering procedures, sampling procedures, and preservation procedures prior to shipping the samples to the laboratory.

The results of supporting quality control (QC) analyses were summarized in the case narrative, included in this review, with the laboratory data package.

Introduction

Seventeen (17) groundwater samples were analyzed for the constituents listed above (Appendix III and Appendix IV constituents in the Coal Combustion Residuals Federal Rule). Table B-1 lists the field sample identifications cross-referenced to the laboratory identifications.

Project Objectives

Project quality QC objectives were established in conformance to the requirements of *SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods* and *Standard Methods*. Laboratory control sample and sample duplicate recovery QC criteria were 70 – 130% recovery (%R) for metals and inorganics. Laboratory recovery QC criteria were 30% Relative Percent Difference (RPD). Field duplicate recovery QC criteria were 50% RPD.

Data Review / Validation Results

Analytical Results

Non-detected results (ND) are reported as less than the value of the method detection limit (MDL) and received a "U" flag. Analytes detected between the method quantitation limit (MQL) and the MDL were qualified with a "J-flag" to denote that the reported value was considered to be estimated. If a QC result was found outside of the review criteria, the reviewer applied a data qualifier and bias code to the associated sample data if the analyte was detected. Sample data were not qualified if recoveries exceeded QC criteria and the analyte was not detected.

Preservation and Holding Times

Samples were evaluated for agreement with the chain-of-custody (COC). All samples were received in the appropriate containers and in good condition with the paperwork filled out properly. Sample receipt temperatures were within the acceptance criteria of 4 ± 2 °C. Samples were prepared and analyzed within holding times as specified in the analysis methods.

Calibrations

The initial and continuing calibration data met laboratory control limits.

Blanks

No field blanks were used because the sampling event did not include volatile or semi-volatile compounds.

All laboratory method blank results were reported as non-detected or below applicable assessment levels with the exception of the following:

For Metals analysis performed on 3/7/2016 Boron was detected below the reporting limit in the method blanks. All associated samples may be biased high for this analyte. No further corrective actions were taken.

For TDS analysis performed on 2/26/2016 TDS was detected at the reporting limit in the method blank. All associated samples were detected greater than 10 times the amount in the blank. No further corrective actions were taken.

No equipment blank was collected

Surrogate Recoveries

The analytical procedures used did not require surrogates; therefore, surrogate recovery is not applicable.

Laboratory Control Samples

Laboratory control sample (LCS) recoveries were within QC acceptance limits for all LCS analyses.

Matrix Spike/Matrix Spike Duplicates

MS/MSD percent recoveries were within acceptable control limits for all samples with the exception of the following:

For Metals analysis performed on 3/7/2016 the matrix spike and matrix spike duplicate recoveries were above control limits for Boron. These are flagged accordingly in the QC summary report. The sample selected for the MS and MSD was not from this work order. The LCS was within control limits for this analyte. No further corrective actions were taken.

Field Precision

No sample duplicates were taken during this sampling event.

Field Procedures

Groundwater samples were collected using low-flow procedures with a peristaltic, stainless steel submersible pump, or bladder pump and placed in unpreserved 250-ml plastic bottles and 500-ml plastic bottles preserved with HNO_3. Wells were purged until groundwater parameters (temperature, pH, specific conductivity, dissolved oxygen, redox, and turbidity) stabilized to within +/- 10%.

Summary

Groundwater analytical data are usable for the purpose of determining current COC concentrations in the groundwater at the site with no qualifications added as a result of this evaluation.

Data Usability Summary
Luminant – Martin Lake Steam Electric Station
April 5-6, 2016
Groundwater Monitoring Event
DHL Analytical Data Packages 1604052 and 1604071

Pastor, Behling & Wheeler, LLC reviewed two data packages from DHL Analytical for the analysis of groundwater samples collected April 5-6, 2016 at the Martin Lake Steam Electric Station in Tatum, Texas. Data were reviewed for adherence to project objectives.

Intended Use of Data: To provide current data on concentrations of chemicals of concern (COCs) in the groundwater at the site.

Analyses requested included:

- Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Lead, Lithium, Molybdenum, Selenium, and Thallium by USEPA Method SW6020A – Metals Analysis;
- Chloride, Fluoride, and Sulfate by USEPA Method E300 – Anion Analysis;
- Mercury by USEPA Method SW7470A – Mercury Analysis;
- pH of Water by Standard Method M4500-H + B – pH of Water Analysis;
- Total Dissolved Solids (TDS) by Standard Method M2540C – TDS Analysis; and
- Radium 226 and 228 by USEPA Methods 904.0/SW846 9320 Modified and 903.1 Modified.

Data were reviewed and validated and the results of the review/validation are discussed in this Data Usability Summary (DUS). The following laboratory submittals and field data were examined:

- the reportable data,
- case narratives, and
- field notes with respect to field instrument calibrations, filtering procedures, sampling procedures, and preservation procedures prior to shipping the samples to the laboratory.

The results of supporting quality control (QC) analyses were summarized in the case narrative, included in this review, with the laboratory data package.

Introduction

Nineteen (19) groundwater samples were analyzed for the constituents listed above (Appendix III and Appendix IV constituents in the Coal Combustion Residuals Federal Rule). Table B-1 lists the field sample identifications cross-referenced to the laboratory identifications.

Project Objectives

Project quality QC objectives were established in conformance to the requirements of *SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods* and *Standard Methods*. Laboratory control sample and sample duplicate recovery QC criteria were 70 – 130% recovery (%R) for metals and inorganics. Laboratory recovery QC criteria were 30% Relative Percent Difference (RPD). Field duplicate recovery QC criteria were 50% RPD.

Data Review / Validation Results

Analytical Results

Non-detected results (ND) are reported as less than the value of the method detection limit (MDL) and received a "U" flag. Analytes detected between the method quantitation limit (MQL) and the MDL were qualified with a "J-flag" to denote that the reported value was considered to be estimated. If a QC result was found outside of the review criteria, the reviewer applied a data qualifier and bias code to the associated sample data if the analyte was detected. Sample data were not qualified if recoveries exceeded QC criteria and the analyte was not detected.

Preservation and Holding Times

Samples were evaluated for agreement with the chain-of-custody (COC). All samples were received in the appropriate containers and in good condition with the paperwork filled out properly. Sample receipt temperatures were within the acceptance criteria of 4 ± 2 °C. Samples were prepared and analyzed within holding times as specified in the analysis methods.

Calibrations

The initial and continuing calibration data met laboratory control limits.

Blanks

No field blanks were used because the sampling event did not include volatile or semi-volatile compounds.

All laboratory method blank results were reported as non-detected or below applicable assessment levels.

One equipment blank was collected, with all results being below applicable assessment levels.

Surrogate Recoveries

The analytical procedures used did not require surrogates; therefore, surrogate recovery is not applicable.

Laboratory Control Samples

Laboratory control sample (LCS) recoveries were within QC acceptance limits for all LCS analyses.

Matrix Spike/Matrix Spike Duplicates

MS/MSD percent recoveries were within acceptable control limits for all samples with the exception of the following:

For Metals analysis performed on 4/8/2016, 4/11/2016, and 4/15/2016 (data package 1604052) the matrix spike and matrix spike duplicate recoveries were out of control limits for Boron and/or Calcium. These are flagged accordingly in the QC summary report. The sample selected for the MS and MSD on 4/8/2016 was not from this work order. The sample selected for the MS and MSD on 4/11/2016 and 4/15/2016 was from this work order. The LCSs were within control limits for these analytes. No further corrective actions were taken.

For Metals analysis performed on 4/11/2016, 4/15/2016, and 4/20/2016 (data package 1604071) the matrix spike or matrix spike duplicate recoveries were out of control limits for Boron and/or Calcium

These are flagged accordingly in the QC summary report. The samples selected for the MSs and MSDs were not from this work order. The LCSs were within control limits for these analytes. No further corrective actions were taken.

Field Precision

Field duplicate precision met the quality objective of RPDs <50% for the pair collected at H-30 for all constituents except for Lead. The results for this constituent for both the parent and duplicate samples have been flagged accordingly in the Appendix III and Appendix IV Baseline Groundwater Analytical Data tables.

Analytical testing for Radium 226 and 228 has reported inherent variability. The lab reports a result and a margin of error. To determine the acceptability of the duplicate sample, the margin of error for combined Radium is added and subtracted from the result to give a range in which the true result lies. If the parent range and duplicate range overlap, the duplicate data is considered acceptable. The parent and duplicate range overlap, and the duplicate data is considered acceptable.

Field Procedures

Groundwater samples were collected using low-flow procedures with a peristaltic, stainless steel submersible pump, or bladder pump and placed in unpreserved 250-ml plastic bottles and 500-ml plastic bottles preserved with HNO_3. Wells were purged until groundwater parameters (temperature, pH, specific conductivity, dissolved oxygen, redox, and turbidity) stabilized to within +/- 10%.

Summary

Groundwater analytical data are usable for the purpose of determining current COC concentrations in the groundwater at the site with no qualifications added as a result of this evaluation.

Data Usability Summary
Luminant – Martin Lake Steam Electric Station
June 7, 2016
Groundwater Monitoring Event
DHL Analytical Data Package 1606075

Pastor, Behling & Wheeler, LLC reviewed one data package from DHL Analytical for the analysis of groundwater samples collected June 7, 2016 at the Martin Lake Steam Electric Station in Tatum, Texas. Data were reviewed for adherence to project objectives.

Intended Use of Data: To provide current data on concentrations of chemicals of concern (COCs) in the groundwater at the site.

Analyses requested included:

- Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Lead, Lithium, Molybdenum, Selenium, and Thallium by USEPA Method SW6020A – Metals Analysis;
- Chloride, Fluoride, and Sulfate by USEPA Method E300 – Anion Analysis;
- Mercury by USEPA Method SW7470A – Mercury Analysis;
- pH of Water by Standard Method M4500-H + B – pH of Water Analysis;
- Total Dissolved Solids (TDS) by Standard Method M2540C – TDS Analysis; and
- Radium 226 and 228 by USEPA Methods 904.0/SW846 9320 Modified and 903.1 Modified.

Data were reviewed and validated and the results of the review/validation are discussed in this Data Usability Summary (DUS). The following laboratory submittals and field data were examined:

- the reportable data,
- case narratives, and
- field notes with respect to field instrument calibrations, filtering procedures, sampling procedures, and preservation procedures prior to shipping the samples to the laboratory.

The results of supporting quality control (QC) analyses were summarized in the case narrative, included in this review, with the laboratory data package.

Introduction

Nine (9) groundwater samples were analyzed for the constituents listed above (Appendix III and Appendix IV constituents in the Coal Combustion Residuals Federal Rule). Table B-1 lists the field sample identifications cross-referenced to the laboratory identifications.

Project Objectives

Project quality QC objectives were established in conformance to the requirements of *SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods* and *Standard Methods*. Laboratory control sample and sample duplicate recovery QC criteria were 70 – 130% recovery (%R) for metals and inorganics. Laboratory recovery QC criteria were 30% Relative Percent Difference (RPD). Field duplicate recovery QC criteria were 50% RPD.

Data Review / Validation Results

Analytical Results

Non-detected results (ND) are reported as less than the value of the method detection limit (MDL) and received a "U" flag. Analytes detected between the method quantitation limit (MQL) and the MDL were qualified with a "J-flag" to denote that the reported value was considered to be estimated. If a QC result was found outside of the review criteria, the reviewer applied a data qualifier and bias code to the associated sample data if the analyte was detected. Sample data were not qualified if recoveries exceeded QC criteria and the analyte was not detected.

Preservation and Holding Times

Samples were evaluated for agreement with the chain-of-custody (COC). All samples were received in the appropriate containers and in good condition with the paperwork filled out properly. Sample receipt temperatures were within the acceptance criteria of 4 ± 2 °C. Samples were prepared and analyzed within holding times as specified in the analysis methods.

Calibrations

The initial and continuing calibration data met laboratory control limits with the exception of the following:

For Metals analysis performed on 6/10/2016 LCVL-160610 was slightly below control limits for Beryllium. This is flagged accordingly. The associated CCV-160610 was within control limits for this analyte. No further corrective actions were taken.

Blanks

No field blanks were used because the sampling event did not include volatile or semi-volatile compounds.

All laboratory method blank results were reported as non-detected or below applicable assessment levels.

One equipment blank was collected, with all results being below applicable assessment levels.

Surrogate Recoveries

The analytical procedures used did not require surrogates; therefore, surrogate recovery is not applicable.

Laboratory Control Samples

Laboratory control sample (LCS) recoveries were within QC acceptance limits for all LCS analyses.

Matrix Spike/Matrix Spike Duplicates

MS/MSD percent recoveries were within acceptable control limits for all samples with the exception of the following:

For Mercury analysis performed on 6/17/2016 the matrix spike and matrix spike duplicate recoveries were below control limits. These are flagged accordingly in the QC summary report. The sample selected for the MS and MSD was from this work order. The LCS was within control limits. No further corrective actions were taken.

Field Precision

Field duplicate precision met the quality objective of RPDs <50% for the pair collected at H-30 for all constituents.

Analytical testing for Radium 226 and 228 has reported inherent variability. The lab reports a result and a margin of error. To determine the acceptability of the duplicate sample, the margin of error for combined Radium is added and subtracted from the result to give a range in which the true result lies. If the parent range and duplicate range overlap, the duplicate data is considered acceptable. The parent and duplicate range overlap, and the duplicate data is considered acceptable.

Field Procedures

Groundwater samples were collected using low-flow procedures with a peristaltic, stainless steel submersible pump, or bladder pump and placed in unpreserved 250-ml plastic bottles and 500-ml plastic bottles preserved with HNO_3. Wells were purged until groundwater parameters (temperature, pH, specific conductivity, dissolved oxygen, redox, and turbidity) stabilized to within +/- 10%.

Summary

Groundwater analytical data are usable for the purpose of determining current COC concentrations in the groundwater at the site with no qualifications added as a result of this evaluation.

Data Usability Summary
Luminant – Martin Lake Steam Electric Station
August 9-11, 2016
Groundwater Monitoring Event
DHL Analytical Data Package 1608133

Pastor, Behling & Wheeler, LLC reviewed one data package from DHL Analytical for the analysis of groundwater samples collected August 9-11, 2016 at the Martin Lake Steam Electric Station in Tatum, Texas. Data were reviewed for adherence to project objectives.

Intended Use of Data: To provide current data on concentrations of chemicals of concern (COCs) in the groundwater at the site.

Analyses requested included:

- Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Lead, Lithium, Molybdenum, Selenium, and Thallium by USEPA Method SW6020A – Metals Analysis;
- Chloride, Fluoride, and Sulfate by USEPA Method E300 – Anion Analysis;
- Mercury by USEPA Method SW7470A – Mercury Analysis;
- pH of Water by Standard Method M4500-H + B – pH of Water Analysis;
- Total Dissolved Solids (TDS) by Standard Method M2540C – TDS Analysis; and
- Radium 226 and 228 by USEPA Methods 904.0/SW846 9320 Modified and 903.1 Modified.

Data were reviewed and validated and the results of the review/validation are discussed in this Data Usability Summary (DUS). The following laboratory submittals and field data were examined:

- the reportable data,
- case narratives, and
- field notes with respect to field instrument calibrations, filtering procedures, sampling procedures, and preservation procedures prior to shipping the samples to the laboratory.

The results of supporting quality control (QC) analyses were summarized in the case narrative, included in this review, with the laboratory data package.

Introduction

Twenty seven (27) groundwater samples were analyzed for the constituents listed above (Appendix III and Appendix IV constituents in the Coal Combustion Residuals Federal Rule). Table B-1 lists the field sample identifications cross-referenced to the laboratory identifications.

Project Objectives

Project quality QC objectives were established in conformance to the requirements of *SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods* and *Standard Methods*. Laboratory control sample and sample duplicate recovery QC criteria were 70 – 130% recovery (%R) for metals and inorganics. Laboratory recovery QC criteria were 30% Relative Percent Difference (RPD). Field duplicate recovery QC criteria were 50% RPD.

Data Review / Validation Results

Analytical Results

Non-detected results (ND) are reported as less than the value of the method detection limit (MDL) and received a "U" flag. Analytes detected between the method quantitation limit (MQL) and the MDL were qualified with a "J-flag" to denote that the reported value was considered to be estimated. If a QC result was found outside of the review criteria, the reviewer applied a data qualifier and bias code to the associated sample data if the analyte was detected. Sample data were not qualified if recoveries exceeded QC criteria and the analyte was not detected.

Preservation and Holding Times

Samples were evaluated for agreement with the chain-of-custody (COC). All samples were received in the appropriate containers and in good condition with the paperwork filled out properly. Sample receipt temperatures were within the acceptance criteria of 4 ± 2 °C. Samples were prepared and analyzed within holding times as specified in the analysis methods.

Calibrations

The initial and continuing calibration data met laboratory control limits with the exception of the following:

For Metals analysis performed on 8/18/2016 and 8/22/2016 LCVL3-160818 and LCVL2-160822 were out of control limits for Boron and Beryllium, respectively. These are flagged accordingly. The associated CCV3-160818 and CCV2-160822 were within control limits for these analytes. No further corrective actions were taken.

Blanks

No field blanks were used because the sampling event did not include volatile or semi-volatile compounds.

All laboratory method blank results were reported as non-detected or below applicable assessment levels.

One equipment blank was collected, with all results being below applicable assessment levels.

Surrogate Recoveries

The analytical procedures used did not require surrogates; therefore, surrogate recovery is not applicable.

Laboratory Control Samples

Laboratory control sample (LCS) recoveries were within QC acceptance limits for all LCS analyses.

Matrix Spike/Matrix Spike Duplicates

MS/MSD percent recoveries were within acceptable control limits for all samples with the exception of the following:

For Metals analysis (batch 76817) the matrix spike and matrix spike duplicate had low responses for the internal standard Bismuth. The associated analyte (Lead) was within control limits. No further corrective actions were taken.

For Metals analysis performed on 8/17/2016, 8/19/2016, 8/22/2016, 8/23/2016, and 8/24/2016, the matrix spike and matrix spike duplicate recoveries were outside control limits for a total of nine analytes. These are flagged accordingly in the QC summary report. The samples selected for the MS and MSD were not from this work order. The LCSs were within control limits for these analytes. No further corrective actions were taken.

Serial Dilution/Post Dilution Spikes

For Metals analysis performed on 8/23/2016, the PDS recovery was below control limits for Lithium. This is flagged accordingly. The serial dilution was within control limits for this analyte. No further corrective actions were taken.

Field Precision

Field duplicate precision met the quality objective of RPDs <50% for the pair collected at H-30 for all constituents.

Analytical testing for Radium 226 and 228 has reported inherent variability. The lab reports a result and a margin of error. To determine the acceptability of the duplicate sample, the margin of error for combined Radium is added and subtracted from the result to give a range in which the true result lies. If the parent range and duplicate range overlap, the duplicate data is considered acceptable. The parent and duplicate range overlap, and the duplicate data is considered acceptable.

Field Procedures

Groundwater samples were collected using low-flow procedures with a peristaltic, stainless steel submersible pump, or bladder pump and placed in unpreserved 250-ml plastic bottles and 500-ml plastic bottles preserved with HNO_3. Wells were purged until groundwater parameters (temperature, pH, specific conductivity, dissolved oxygen, redox, and turbidity) stabilized to within +/- 10%.

Summary

Groundwater analytical data are usable for the purpose of determining current COC concentrations in the groundwater at the site with no qualifications added as a result of this evaluation.

- Total Dissolved Solids (TDS) by Standard Method M2540C – TDS Analysis; and
- Radium 226 and 228 by USEPA Methods 904.0/SW846 9320 Modified and 903.1 Modified.

Data were reviewed and validated and the results of the review/validation are discussed in this Data Usability Summary (DUS). The following laboratory submittals and field data were examined:

- the reportable data,
- case narratives, and
- field notes with respect to field instrument calibrations, filtering procedures, sampling procedures, and preservation procedures prior to shipping the samples to the laboratory.

The results of supporting quality control (QC) analyses were summarized in the case narrative, included in this review, with the laboratory data package.

Introduction

Eight (8) groundwater samples were analyzed for the constituents listed above (Appendix III and Appendix IV constituents in the Coal Combustion Residuals Federal Rule). Table B-1 lists the field sample identifications cross-referenced to the laboratory identifications.

Project Objectives

Project quality QC objectives were established in conformance to the requirements of *SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods* and *Standard Methods*. Laboratory control sample and sample duplicate recovery QC criteria were 70 – 130% recovery (%R) for metals and inorganics. Laboratory recovery QC criteria were 30% Relative Percent Difference (RPD). Field duplicate recovery QC criteria were 50% RPD.

Data Review / Validation Results

Analytical Results

Non-detected results (ND) are reported as less than the value of the method detection limit (MDL) and received a "U" flag. Analytes detected between the method quantitation limit (MQL) and the MDL were qualified with a "J-flag" to denote that the reported value was considered to be estimated. If a QC result was found outside of the review criteria, the reviewer applied a data qualifier and bias code to the associated sample data if the analyte was detected. Sample data were not qualified if recoveries exceeded QC criteria and the analyte was not detected.

Preservation and Holding Times

Samples were evaluated for agreement with the chain-of-custody (COC). All samples were received in the appropriate containers and in good condition with the paperwork filled out properly. Sample receipt temperatures were within the acceptance criteria of 4 ± 2 °C. Samples were prepared and analyzed within holding times as specified in the analysis methods.

Calibrations

The initial and continuing calibration data met laboratory control limits for all constituents.

Blanks

No field blanks were used because the sampling event did not include volatile or semi-volatile compounds.

All laboratory method blank results were reported as non-detected or below applicable assessment levels.

No equipment blank was collected during this sampling event.

Surrogate Recoveries

The analytical procedures used did not require surrogates; therefore, surrogate recovery is not applicable.

Laboratory Control Samples

Laboratory control sample (LCS) recoveries were within QC acceptance limits for all LCS analyses.

Matrix Spike/Matrix Spike Duplicates

MS/MSD percent recoveries were within acceptable control limits for all samples.

Serial Dilution/Post Dilution Spikes

SD/PDS percent recoveries were within acceptable control limits for all samples.

Field Precision

Field duplicate precision met the quality objective of RPDs <50% for the pair collected at H-31 for all constituents except for Arsenic, Beryllium, Cobalt, and Selenium. The results for these constituents for both the parent and duplicate samples have been J-flagged accordingly in the Appendix III and Appendix IV Baseline Groundwater Analytical Data tables.

Analytical testing for Radium 226 and 228 has reported inherent variability. The lab reports a result and a margin of error. To determine the acceptability of the duplicate sample, the margin of error for combined Radium is added and subtracted from the result to give a range in which the true result lies. If the parent range and duplicate range overlap, the duplicate data is considered acceptable. The parent and duplicate range overlap, and the duplicate data is considered acceptable.

Field Procedures

Groundwater samples were collected using low-flow procedures with a peristaltic, stainless steel submersible pump, or bladder pump and placed in unpreserved 250-ml plastic bottles and 500-ml plastic bottles preserved with HNO_3. Wells were purged until groundwater parameters (temperature, pH, specific conductivity, dissolved oxygen, redox, and turbidity) stabilized to within +/- 10%.

Summary

Groundwater analytical data are usable for the purpose of determining current COC concentrations in the groundwater at the site with no qualifications added as a result of this evaluation.

Data Usability Summary
Luminant – Martin Lake Steam Electric Station
December 11, 2016
Groundwater Monitoring Event
DHL Analytical Data Package 1612132

Pastor, Behling & Wheeler, LLC reviewed one data package from DHL Analytical for the analysis of groundwater samples collected December 11, 2016 at the Martin Lake Steam Electric Station in Tatum, Texas. Data were reviewed for adherence to project objectives.

Intended Use of Data: To provide current data on concentrations of chemicals of concern (COCs) in the groundwater at the site.

Analyses requested included:

- Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Calcium, Chromium, Cobalt, Lead, Lithium, Molybdenum, Selenium, and Thallium by USEPA Method SW6020A – Metals Analysis;
- Chloride, Fluoride, and Sulfate by USEPA Method E300 – Anion Analysis;
- Mercury by USEPA Method SW7470A – Mercury Analysis;
- pH of Water by Standard Method M4500-H + B – pH of Water Analysis;
- Total Dissolved Solids (TDS) by Standard Method M2540C – TDS Analysis; and
- Radium 226 and 228 by USEPA Methods 904.0/SW846 9320 Modified and 903.1 Modified.

Data were reviewed and validated and the results of the review/validation are discussed in this Data Usability Summary (DUS). The following laboratory submittals and field data were examined:

- the reportable data,
- case narratives, and
- field notes with respect to field instrument calibrations, filtering procedures, sampling procedures, and preservation procedures prior to shipping the samples to the laboratory.

The results of supporting quality control (QC) analyses were summarized in the case narrative, included in this review, with the laboratory data package.

Introduction

Eight (8) groundwater samples were analyzed for the constituents listed above (Appendix III and Appendix IV constituents in the Coal Combustion Residuals Federal Rule). Table B-1 lists the field sample identifications cross-referenced to the laboratory identifications.

Project Objectives

Project quality QC objectives were established in conformance to the requirements of *SW-846 Test Methods for Evaluating Solid Waste Physical/Chemical Methods* and *Standard Methods*. Laboratory control sample and sample duplicate recovery QC criteria were 70 – 130% recovery (%R) for metals and inorganics. Laboratory recovery QC criteria were 30% Relative Percent Difference (RPD). Field duplicate recovery QC criteria were 50% RPD.

Data Review / Validation Results

Analytical Results

Non-detected results (ND) are reported as less than the value of the method detection limit (MDL) and received a "U" flag. Analytes detected between the method quantitation limit (MQL) and the MDL were qualified with a "J-flag" to denote that the reported value was considered to be estimated. If a QC result was found outside of the review criteria, the reviewer applied a data qualifier and bias code to the associated sample data if the analyte was detected. Sample data were not qualified if recoveries exceeded QC criteria and the analyte was not detected.

Preservation and Holding Times

Samples were evaluated for agreement with the chain-of-custody (COC). All samples were received in the appropriate containers and in good condition with the paperwork filled out properly. Sample receipt temperatures were within the acceptance criteria of 4 ± 2 °C. Samples were prepared and analyzed within holding times as specified in the analysis methods.

Calibrations

The initial and continuing calibration data met laboratory control limits for all constituents with the exception of the following:

For Metals analysis performed on 12/15/2016 Boron was detected above the reporting limit in CCV8-161215. The associated samples are QC samples only. No further corrective actions were taken.

For Metals analysis performed on 12/15/2016 CCV7-161215, LCVL7-161215, CCV8-161215, and LCVL8-161215 were above control limits for Boron. These are flagged accordingly. The associated samples were QC samples only. No further corrective actions were taken.

For Metals analysis performed on 12/16/2016 LCVL4-161216 and LCVL5-161216 were out of control limits for Boron. These are flagged accordingly. The associated CCVs were within control limits for this analyte. No further corrective actions were taken.

Blanks

No field blanks were used because the sampling event did not include volatile or semi-volatile compounds.

All laboratory method blank results were reported as non-detected or below applicable assessment levels.

No equipment blank was collected during this sampling event.

Surrogate Recoveries

The analytical procedures used did not require surrogates; therefore, surrogate recovery is not applicable.

Laboratory Control Samples

Laboratory control sample (LCS) recoveries were within QC acceptance limits for all LCS analyses.

Matrix Spike/Matrix Spike Duplicates

MS/MSD percent recoveries were within acceptable control limits for all samples with the exception of the following:

For Metals analysis performed on 12/15/2016 the matrix spike and matrix spike duplicate recoveries were out of control limits for Boron and/or Calcium. These are flagged accordingly in the QC summary report. The sample selected for the MS and MSD was from this work order. The percent recoveries for the LCS were within control limits for these analytes. No further corrective actions were taken.

Serial Dilution/Post Dilution Spikes

SD/PDS percent recoveries were within acceptable control limits for all samples with the exception of the following:

For Metals analysis performed on 12/20/2016 the RPD for the serial dilution was slightly above control limits for Boron. This is flagged accordingly. The PDS was within control limits for this analyte. No further corrective actions were taken.

Field Precision

Field duplicate precision met the quality objective of RPDs <50% for the pair collected at H-31 for all constituents except for Arsenic and Cobalt. The results for these constituents for both the parent and duplicate samples have been J-flagged accordingly in the Appendix III and Appendix IV Baseline Groundwater Analytical Data tables.

Analytical testing for Radium 226 and 228 has reported inherent variability. The lab reports a result and a margin of error. To determine the acceptability of the duplicate sample, the margin of error for combined Radium is added and subtracted from the result to give a range in which the true result lies. If the parent range and duplicate range overlap, the duplicate data is considered acceptable. The parent and duplicate range overlap, and the duplicate data is considered acceptable.

Field Procedures

Groundwater samples were collected using low-flow procedures with a peristaltic, stainless steel submersible pump, or bladder pump and placed in unpreserved 250-ml plastic bottles and 500-ml plastic bottles preserved with HNO_3. Wells were purged until groundwater parameters (temperature, pH, specific conductivity, dissolved oxygen, redox, and turbidity) stabilized to within +/- 10%.

Summary

Groundwater analytical data are usable for the purpose of determining current COC concentrations in the groundwater at the site with no qualifications added as a result of this evaluation.

APPENDIX C

Statistical Approach to Establishing Baseline Concentrations

Appendix C. STATISTICAL APPROACH TO ESTABLISHING BASELINE CONCENTRATIONS

This appendix summarizes the statistical approach used for establishing baseline groundwater quality concentrations for the Ash Pond Area Coal Combustion Residual (CCR) groundwater monitoring system. The following statistical approach was selected to demonstrate groundwater compliance under the CCR Rule:

- Use of interwell data evaluations, which compare new sample data to data from upgradient or background monitoring wells.

- Use of upper prediction limits (UPLs) to develop site-specific background concentrations for all Appendix III and Appendix IV constituents. This approach is a common statistical method used to evaluate groundwater compliance for Subtitle D landfill facilities and is one of the approved options for groundwater quality data statistical evaluations under the CCR Rule.

- Appendix III constituent concentrations from each compliance well are compared to background UPLs to ascertain if a statistically significant increase above background exists. Background UPLs are based on a 1-of-2 resampling approach, meaning that if one or more constituent concentrations in a compliance well are above their respective baseline concentration, a resample can be collected to validate or invalidate the baseline concentration exceedance.

- If assessment monitoring is required, the 95% lower confidence limit of the mean (LCL) is calculated after each assessment monitoring event for each Appendix IV constituent and compliance well. The data set used to calculate LCLs is based on current and historical constituent concentrations for a compliance well. A statistically significant increase over the Groundwater Protection Standard (GWPS) has occurred at a CCR unit when the LCL for at least one assessment monitoring constituent at a well is greater than the appropriate GWPS. Development of the GWPSs is discussed in Section C.4.

This approach follows the Statistical Analysis Plan-Revision 1 (SAP) (Golder, 2022) and conforms to the 40 CFR 257 rules as well as EPA's *Unified Guidance: Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities* (EPA, 2009) (hereafter, referred to as the Unified Guidance) and the American Society for Testing and Materials (ASTM) standard D6312-17, *Developing Appropriate Statistical Approaches for Groundwater Detection Monitoring Programs at waste Disposal Facilities* (ASTM, 2017). The statistical methodology is designed to detect a release from the facility at the earliest indication so that it is protective of human health and the environment.

Section 257.94(b) of the CCR Rule requires that a minimum of eight independent groundwater samples from each background and downgradient well be collected and analyzed for the constituents listed in

Appendix III and IV to Part 257 no later than October 17, 2017. To satisfy this requirement, eight groundwater monitoring events were performed from October 2015 through December 2016 using the three upgradient/background wells (H-26, H-27, and H-33) and the four downgradient compliance wells (H-28, H-29, H-31, and H-32) in the Ash Pond Area CCR monitoring well system.

Prior to performing background data evaluations, data from the upgradient wells were prepared for analysis. Methods for handling field duplicate samples and handling non-detects were implemented during this data preparation phase, as presented in Section C.1. Statistical assumptions were evaluated to assess the independence of background data prior to calculating the UPLs, as discussed in Section C.2. In order to calculate UPLs, the distribution of each data set was defined and a site-wide Type I experiment wise error rate was established. UPLs based on a 1-of-2 resampling approach were calculated for detected constituents to establish baseline values for wells hydraulically upgradient of the CCR units, as further described in Section C.3. Details about the approach used to evaluate detection and assessment monitoring data after baseline concentrations were established are provided in Section C.4.

C.1 Data Preparation

Analytical data from wells in the groundwater monitoring network at a CCR unit during each sampling event are first reviewed for usability after final data packages are received from the laboratory. The analytical data are then prepared for statistical analysis. The raw sample data can be found in Tables C-1 and C-2 for the Appendix III and Appendix IV constituents, respectively.

Methods for handling duplicate and non-detect data are implemented during this data preparation phase to comply with the performance standards outlined in 40 CFR 257.93. Field duplicates and data rejected after data validation are removed from the data set. Only the primary samples are retained for the statistical evaluation.

In accordance with EPA guidance, non-detects were handled by using one of two approaches depending on the percentage of detected concentrations:

- If a constituent was detected in at least 85% of samples, a simple substitution method was used in which half of the sample detection limit was substituted as a proxy concentration (EPA, 2009; EPA, 2000).

- If a constituent was detected in at least 50% of the samples but no more than 85% of the samples, the Robust Regression Order Statistics (RROS) method was used to estimate summary statistics such as the mean and standard deviation (EPA, 2009).

If the constituent was detected in fewer than 50% of the samples, non-detects were handled by using nonparametric statistical approaches to evaluate the data and to prepare summary statistics (EPA, 2009; EPA, 2000). J-flagged data, estimated concentrations between the sample detection limit and the reporting limit, were defined as detected concentrations.

C.2 Statistical Assumptions

In accordance with Section 257.94(6), the background groundwater sample data used in calculating the UPLs were evaluated for seasonal and spatial variability as well as temporal correlation in the data to assess the independence and usability of the background data to calculate UPLs. Statistical independence was checked by testing for:

- Spatial stationarity,
- Temporal stationarity,
- Lack of autocorrelation, and
- Lack of statistical data outliers.

The statistical software **R** (The R Foundation, 2023) and the EnvStats package (Envstats, 2023) were used to perform the statistical tests to check the validity of independent samples.

To identify the statistical significance across the wells and/or detected Appendix III or Appendix IV constituents, a Type I experiment wise error rate, α, of 0.05 was used and a single test error rate was defined for each statistical test. The single test error rate, was based on the number of constituents detected (d^*), and in some cases the number of constituents detected at least 50% of the time, for a given constituent list. For instance, the single test error rate associated with a statistical test for one of the seven detected Appendix III constituents (d^*=7) equals $1-(1-\alpha)^{1/d^*} = 1-(1-\alpha)^{1/7} = 0.0073$.

The spatial stationarity, temporal stationarity, and autocorrelation components are considered addressed after evaluation of the background data as a whole, showing general consistency with the

data obtained. Spatial variability was identified for several Appendix III and IV constituents in the background wells; however, the background sample concentrations for these constituents were generally less than or within the natural range of concentrations in the downgradient wells and less than applicable MCLs. There is no obvious source of the spatial variability observed in the well samples other than natural chemical variability in the uppermost aquifer. Constituent and background well combinations did not exhibit temporal trends or autocorrelation for Appendix III or Appendix IV constituents. As such, the background sample concentrations represent the natural range of Appendix III and Appendix IV constituent concentrations in the uppermost aquifer and are considered usable data for calculating background concentrations.

Handling Outliers

Outliers are "extreme, unusual-looking measurements" and the Unified Guidance recommends testing for outliers to attempt to determine whether a suspect outlier was drawn from the same sample population as the rest of the data.

Before establishing baseline values for the detection monitoring or assessment monitoring programs, two steps were taken to check for suspect outliers for each detected constituent across the upgradient wells: a box plot was created to identify suspect outliers as a basis to identify suspect outliers, and if the constituent had at least 50% detected concentrations then the Dixon's test was performed as a formal test to check if a suspect outlier is also a statistical outlier. Box plots and results for the Dixon's test were generated using the statistical software **R** (The R Foundation, 2023). Box plots are provided in Figures C-1 through C-18 and Table C-3 presents the suspect outliers based on the box plots and presents the results from the Dixon's test, based on a 95% level of confidence.

The suspect outliers based on box plots identified for Appendix III are field pH (one low concentration of 4.35 s.u.). The suspect outliers identified for Appendix IV are barium (two high concentrations of 0.0774 and 0.0785 mg/L), beryllium (two high concentrations of 0.00136 and 0.00146 mg/L), chromium (three high concentrations of 0.0194, 0.0309, and 0.0368 mg/L), cobalt (one high concentration of 0.0644 mg/L), lead (one high concentration of 0.000495 J mg/L), molybdenum (one high concentration of 0.00248 mg/L), and selenium (one detected concentration 0.00265 mg/L). The Dixon's test is appropriate for data sets of fewer than 25 samples, and so Dixon's test was used to evaluate outliers in the baseline data sets. Since there were less than 50% detects for chromium, lead, molybdenum and selenium, the Dixon's test was not performed. The Dixon's test assumes that a data set with the suspect

outlier removed is normally distributed (or lognormally distributed if the data are transformed to the natural-log scale). Furthermore, the Dixon's test can only test if one detected concentration (i.e., the minimum or the maximum) is a statistical outlier. Since two high suspect outliers were identified for barium and beryllium, the Dixon's test was performed only for the highest barium and beryllium detection. The Dixon's test was used to test if the suspect outliers for field pH, barium, beryllium, and cobalt and were statistical outliers. For field pH, the results of the Dixon's test did not indicate that the low suspect outlier was a statistical outlier. For barium and cobalt, the results of the Dixon's test did not indicate that the high suspect outlier for each Appendix IV constituent was a statistical outlier. For beryllium, the results of the Dixon's tests did indicate that the highest suspect outlier was also considered a statistical outlier. Although the high beryllium concentration was identified as a statistical outlier, it is below the MCL and within the range of baseline concentrations for downgradient wells. Therefore, suspect and statistical outliers were all kept in the baseline data set.

C.3 Statistical Approach for Calculating UPLs

UPLs were calculated for each detected constituent across the upgradient wells to establish baseline values for background. UPLs were calculated to include a 1-of-2 retesting strategy to ensure comparisons are statistically powerful and to achieve the site-wide false positive rate (SWFPR). A 1-of-2 retesting strategy means that if one or more constituent concentrations in a compliance well are above their respective baseline concentration, a resample can be collected to validate or invalidate the baseline concentration exceedance.

Background data distributions were defined in accordance with EPA guidance (EPA, 2000; EPA, 2002; EPA, 2009; EPA, 2017; SWDIV, 1998). UPLs were calculated based on the SWFPR and defined background data distribution. Power rates were defined for each calculated UPL. The open source, statistical software **R** (The R Foundation, 2023) was used to perform all statistical distribution tests and to calculate UPLs.

<u>Achieving the SWFPR</u>

UPLs were computed using a significance level that ensures a cumulative SWFPR or Type I experiment wise error rate for yearly monitoring that is no more than 10%. That means, a single test error rate for the UPLs must be considerably lower than 0.10. The single test error rate depends on the number of detected constituents and number of compliance wells evaluated in the CCR monitoring program, defined as: $1-(1-\alpha)^{1/cw}$, where

- α=0.10,
- c=7 or 12, the number detected constituents for the monitoring program for Appendix III and Appendix IV constituents, respectively; and
- w=4, the number of downgradient compliance wells at Ash Pond Area.

The single test error rate for the UPLs is 0.0038 and 0.0022 for the detected Appendix III constituents and Appendix IV constituents, respectively. The Unified Guidance recommends defining the single test error rate for nonparametric UPLs as: $1-(1-\alpha)^{1/c}$, and so the single test error rate for nonparametric UPLs is 0.015 and 0.0087 for the detected Appendix III constituents and Appendix IV constituents, respectively. Since field pH has two bounds, a lower and upper prediction limit, the SWPFR for field pH is one-half of the appropriate SWFPR value shown above.

Defining a Distribution and Type of UPL

The type of UPL calculated is based on a data set's defined distribution. Figure C-19 outlines the steps that were taken to define whether a data set follows a normal, gamma, lognormal, or nonparametric distribution. Distributional test results and defined distributions are presented in Table C-4.

The type of UPL computed (e.g., parametric or nonparametric) was based on the detection frequency and the defined data distribution. For a constituent with no detections in the baseline data, the UPL was set to the reporting limit (EPA, 2009). For a constituent with at least 50% detections, the UPL was adjusted for non-detected concentration(s), as described previously in the Data Preparation section, Section C.1, and the appropriate UPL calculation was based on results from the distributional tests. If no parametric distribution (normal, gamma, or lognormal) was appropriate, then a nonparametric UPL was estimated. The confidence level used for each UPL was based on the appropriate single test error rate.

Defining Power Rate associated with each UPL

The power of each UPL was evaluated and a power rate was defined as good, acceptable, or low. A power rate was defined as 'good' when the power at both 3 standard deviations and 4 standard deviations were above 85%; a power rate was defined as 'acceptable' when power at either 3 standard deviations or 4 standard deviations was between 59% and 85%; and a power rate was defined as 'low' occurs when power at both 3 standard deviations and 4 standard deviations were below 85%.

C.4 Detection and Assessment Monitoring Data Evaluations

Detection and assessment monitoring constituent concentrations are compared to the appropriate baseline value for background or GWPS to determine whether a significant difference exists between the initial and current site conditions. The appropriate baseline value for detection monitoring is the Appendix III constituent's UPL and the appropriate baseline value for assessment monitoring is the Appendix IV constituent's GWPS (Table C-5). The GWPS for each Appendix IV constituent is established as follows:

- For constituents with an established MCL, the GWPS is the highest of the MCL, UPL, or reporting limit for that constituent; or
- For constituents with no established MCL, the GWPS is the highest of the UPL, laboratory reporting limit, and alternative GWPS (as applicable for cobalt, lead, lithium, and molybdenum).

For detection monitoring, a well is defined as in-compliance when all the Appendix III constituent concentrations are less than the appropriate baseline value. If any concentration exceeds the appropriate baseline value, then a resample may be collected, analyzed, and compared to the appropriate baseline value—if this resample exceeds the appropriate baseline value, then a statistically significant increase over baseline is indicated.

For assessment monitoring, a 95% confidence interval of the mean is estimated for each detected Appendix IV constituent in a downgradient well using the current and previous sampling event concentrations. The confidence interval contains both a LCL and an upper confidence limit (UCL). The Unified guidance states that "for testing under compliance/assessment monitoring, a [LCL] around the true parameter is utilized. If the LCL exceeds the standard [GWPS], there is statistically significant evidence in favor that the compliance standard has been violated." A constituent is in-compliance when the LCL for the constituent is less than the appropriate GWPS. (EPA, 2009).

The 95% confidence interval (i.e., the LCL and UCL) is based on the constituent concentrations from the current year's sampling events and historical sampling events at a given well. Confidence intervals are calculated based on the defined data distribution. The data distribution is defined in accordance with EPA guidance (EPA, 2000; EPA, 2002; EPA, 2009; EPA, 2017; SWDIV, 1998). The type of confidence interval computed (e.g., parametric or nonparametric) is based on the detection frequency and the defined data distribution for each data set, as described in Section C.3. For a constituent with no detected concentration measurements, the LCL (and UCL) is set to the reporting limit (EPA, 2009). For a

constituent with at least 50% detections, the LCL (and UCL) calculation adjusts for non-detected concentration(s) as described in Section C.1, and the appropriate LCL (and UCL) calculation is used based on results from the distributional tests. If no parametric distribution (normal, lognormal, or gamma) can be defined for a data set or there are fewer than 50% detections, then a nonparametric, approximate 95% confidence interval of the median is estimated for the LCL and UCL.

NOTE: APPENDIX F-Revision 2 February 27, 2024

Dixon's Test can be performed for only one value.

Statistical Significance for Distributional tests for Dixon's test are based on 95% level of confidence, or α=0.05.

1.0 INTRODUCTION

Permanent Disposal Pond 5 (PDP-5) is located at the Martin Lake Steam Electric Station (MLSES) in Rusk County, Texas (the Site). PDP-5 is used to store coal combustion residuals (CCRs) from other MLSES CCR surface impoundments during cleaning cycles and for storage of water from large precipitation events and excess process wastewater from the MLSES flue gas desulfurization (FGD) system (scrubber gypsum) and bottom ash transport systems.

The federal CCR Rule (Title 40 Code of Federal Regulations (CFR) Section 257 Subpart D - *Standards for the Receipt of Coal Combustion Residuals in Landfills and Surface Impoundments*) has been promulgated by the United States Environmental Protection Agency (USEPA) to regulate the management and disposal of CCRs as solid waste under Resource Conservation and Recovery Act (RCRA) Subtitle D. The final CCR Rule was published in the Federal Register on April 17, 2015. The effective date of the CCR Rule is October 19, 2015. TCEQ adopted portions of the Federal CCR Rule at Title 30 Texas Administrative Code (TAC) Chapter 352 (Texas CCR Rule). The USEPA published its final approval of the Texas CCR Rule on June 28, 2021 and the Texas CCR Rule became effective on July 28, 2021. It adopts and incorporates by reference the Federal CCR Program requirements for groundwater monitoring at 30 TAC Sections 352.901 through 352.951.

The CCR Rule establishes national minimum criteria for existing and new CCR landfills, existing and new CCR surface impoundments, and lateral expansions to landfills/impoundments. 40 C.F.R § 257.93(d) of the CCR Rule requires that the owner or operator of the CCR unit must establish background groundwater quality in a hydraulically upgradient or background well(s) for each of the constituents required in the particular groundwater monitoring program that applies to the CCR unit as determined under 40 C.F.R § 257.94(a) (*Detection Monitoring Program)* and 40 C.F.R § 257.95(a) (*Assessment Monitoring Program)*. 40 C.F.R § 257.94(b) of the CCR Rule requires that a minimum of eight independent groundwater samples from each background and downgradient well associated with a CCR unit be collected and analyzed for the constituents listed in Appendix III and IV to Part 257 no later than October 17, 2017. This report presents a summary of the sampling and analytical activities performed to establish background groundwater quality at the Site.

1.1 Description of PDP-5

PDP-5 was constructed in 2010 and is located approximately 3,000 feet west of the MLSES power units (Figure 1). PDP-5 is registered with the Texas Commission on Environmental Quality (TCEQ) as industrial solid waste management unit (WMU) No. 024 under Solid Waste Registration No. 31227. PDP-5 was constructed above grade and is surrounded by earthen embankments that extend approximately 10 to 15 feet above the adjacent ground surface. The elevation of the top of the PDP-5 berms is approximately El. 405.5. The maximum operating water surface elevation in PDP-5 is approximately El. 403.5. PDP-5 was constructed on top of three closed in-place, non-CCR Rule regulated, former coal ash surface impoundments (PDP-1, PDP-2 and PDP-3) and is adjacent to one former coal ash surface impoundment (PDP-4) that historically received wastewater streams and solids similar to those currently managed in PDP-5.

1.2 PDP-5 Groundwater Monitoring System

The PDP-5 CCR groundwater monitoring system has been certified by a professional engineer in accordance with 40 C.F.R § 257.91 of the CCR Rule (PBW, 2017; WSP Golder, 2022a). The PDP-5 CCR groundwater monitoring well system consists of nine monitoring wells (MW-17A, MW-18A, MW-19, MW-20A, PDP-22, PDP-23, PDP-24, PDP-25, PDP-26) that are each screened in the uppermost aquifer at the Site. The locations of the PDP-5 CCR groundwater monitoring wells are shown on Figure 2. Topographic and groundwater elevations at PDP 5 are higher than those in the surrounding area. Based on the inferred direction of groundwater flow, there are no upgradient areas in the vicinity of PDP 5 and all the PDP-5 CCR groundwater monitoring wells are downgradient wells. Groundwater potentiometric surface maps from the background monitoring period are provided in Appendix A.

2.0 BACKGROUND GROUNDWATER MONITORING PROGRAM

This section describes groundwater sampling and analysis procedures used in the background monitoring program.

2.1 Groundwater Sampling Procedures

Groundwater sampling was performed in accordance with the Site Groundwater Monitoring Plan-Revision 2 (WSP Golder, 2022b). Water levels were measured in each well to the nearest 0.01-foot prior to purging or sampling the wells. The wells were purged using low-flow methods until field water quality parameters stabilized, after which a groundwater sample was collected in a laboratory-supplied container. After the samples were collected, the sample containers were placed in a cooler or similar container, preserved with ice, and delivered to the laboratory for analysis.

2.2 Analytes and Analytical Procedures

Groundwater samples collected during the initial background period (October 2015 – December 2016) were analyzed for the constituents listed in Appendix III and IV to Part 257, including:

Appendix III Constituents	Appendix IV Constituents
Boron	Arsenic
Calcium	Barium
Chloride	Beryllium
Fluoride	Cadmium
pH	Chromium
Sulfate	Cobalt
Total Dissolved Solids (TDS)	Fluoride
	Lead
	Lithium
	Mercury
	Molybdenum
	Selenium
	Thallium
	Radium 226 and 228 (combined)

The laboratory methods used to analyze the Appendix III and IV constituents were as follows:

Appendix III Constituents

- Boron and calcium by USEPA Method SW6020;
- Chloride, fluoride, and sulfate by USEPA Method E300;
- pH by Standard Method M4500-H + B (field measurement); and
- TDS by Standard Method M2540.

Appendix IV Constituents

- Antimony, arsenic, barium, beryllium, cadmium, chromium, cobalt, lead, lithium, molybdenum, selenium, and thallium by USEPA Method SW6020;
- Fluoride USEPA Method E300;
- Mercury by USEPA Method SW7470; and
- Radium 226 and 228 by USEPA Methods 904.0/SW9320 Modified and 903.1 Modified.

All metals analyses were reported as “total recoverable metals” in accordance with 40 C.F.R § 257.93(1) of the CCR Rule. Samples were not filtered prior to analysis.

2.3 Background Groundwater Monitoring Sampling Results

Eight initial background groundwater monitoring events were performed using the monitoring well system from October 2015 through December 2016. The laboratory analytical reports for the initial background samples are presented in Appendix B and the background sample data are summarized in Appendix C, Table C-1 (Appendix III) and Table C-2 (Appendix IV).

2.4 Establishing Background Assessment Levels

The following statistical evaluation approach was selected to develop background groundwater quality assessment levels for the Site:

- Use of intrawell data evaluations, which compare new sample data to historical data at each groundwater monitoring well independently.

- Use of upper prediction limits (UPLs) to develop site-specific background concentrations for all Appendix III and Appendix IV constituents. This approach is a common statistical method used to evaluate groundwater compliance for Subtitle D landfill facilities and is one of the approved options for groundwater quality data statistical evaluations under the CCR Rule.

Documentation on the statistical procedures used to establish background UPLs is presented in Appendix C.

2.5 Updating Background Assessment Levels

PDP-5 is currently in a Detection Monitoring Program as defined by 40 C.F.R. §257.94. The initial Detection Monitoring Program groundwater samples were collected from the PDP-5 CCR monitoring well network in October 2017. Subsequent Detection Monitoring Program groundwater samples have been collected on a semi-annual basis since that time. Data evaluation is completed using procedures described in the Statistical Analysis Plan (WSP Golder, 2022c) to identify statistically significant increases (SSIs) of Appendix III parameters

over background concentrations.

SSIs of Appendix III parameters were identified during the 2018 through 2023 sampling events. An initial Alternate Source Demonstration was completed in 2019, which indicated that a source other than the CCR unit caused SSIs observed in the 2018 sample data. Similarly, Alternate Source Demonstrations were completed each year from 2020 to 2023 based on the previous year's groundwater sample data and were included as an attachment to the Annual Groundwater Monitoring and Corrective Action Reports in accordance with 40 C.F.R. §257.94(e)(2).

Appendix III background concentrations have been updated as part of this report to address the recurring Appendix III SSIs for which alternate source demonstrations have been successfully completed in the past. The updated background concentrations are based on sampling data collected from the initial background monitoring event in November 2015 through August 2023. Appendix IV sample data have not been collected since the initial background monitoring period because the CCR unit has remained in the Detection Monitoring Program; therefore, only Appendix III background concentrations were updated in this report. The process used for updating the Appendix III background concentrations is discussed further in Appendix C.

3.0 DETECTION AND ASSESSMENT MONITORING DATA EVALUATION PROCEDURES

Statistical analysis of groundwater monitoring data is required as part of detection monitoring and assessment monitoring under 40 C.F.R § 257.93 of the CCR Rule, and adopted by the state of Texas at 30 T.A.C. § 352.931. The CCR Rule provides several options for statistically evaluating groundwater data. The owner or operator of the CCR unit must select one of the following statistical methods specified in paragraphs (f)(1) through (5) of 40 C.F.R § 257.93 to evaluate groundwater monitoring data for each specified constituent:

(1) A parametric analysis of variance followed by multiple comparison procedures to identify statistically significant evidence of contamination. The method must include estimation and testing of the contrasts between each compliance well's mean and the background mean levels for each constituent.

(2) An analysis of variance based on ranks followed by multiple comparison procedures to identify statistically significant evidence of contamination. The method must include estimation and testing of the contrasts between each compliance well's median and the background median levels for each constituent.

(3) A tolerance or prediction interval procedure, in which an interval for each constituent is established from the distribution of the background data and the level of each constituent in each compliance well is compared to the upper tolerance or prediction limit.

(4) A control chart approach that gives control limits for each constituent.

(5) Another statistical test method that meets the performance standards of paragraph (g) of this section.

The following statistical evaluation approaches were selected to demonstrate groundwater compliance for PDP-5 under the CCR Rule:

- Use of intrawell data evaluations, which compare new sample data to historical data at each groundwater monitoring well independently.
- Use of UPLs to develop site-specific background concentrations for all Appendix III and Appendix IV constituents. This approach is a common statistical method used to evaluate groundwater compliance for Subtitle D landfill facilities and is one of the approved options for groundwater quality data statistical evaluations under the CCR Rule.
- After detection monitoring events, Appendix III constituent concentrations from each well are compared to background UPLs to ascertain if a statistically significant increase above background exists. Background UPLs are based on a 1-of-2 resampling

approach, meaning that if one or more constituent concentrations in a compliance well are above their respective background concentration, a resample can be collected to validate or invalidate the background concentration exceedance.

- If in assessment monitoring, the 95% lower confidence limit of the mean (LCL) is calculated after each assessment monitoring event for each Appendix IV constituent. The data set used to calculate LCLs is based on current and historical constituent concentrations. A statistically significant increase over the Groundwater Protection Standard (GWPS) has occurred at a CCR unit when the LCL for at least one assessment monitoring constituent at a well is greater than the appropriate GWPS. Development of the GWPSs is discussed in Section 3.2 and statistical procedures used to develop LCLs are discussed in Appendix C.

The selected statistical evaluation procedures conform with the CCR Rule requirements, as well as the Statistical Analysis Plan for the Site (WSP Golder, 2022c), USEPA's *Unified Guidance: Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities* (USEPA, 2009), and the American Society for Testing and Materials (ASTM) standard D6312-17, *Developing Appropriate Statistical Approaches for Groundwater Detection Monitoring Programs at waste Disposal Facilities* (ASTM, 2017).

3.1 Detection Monitoring Data Evaluation

Background UPLs are based on a 1-of-2 resampling approach, meaning that if zero or one concentration measurements from a series of two independent samples collected from a well do not exceed the appropriate UPL, then a statistically significant increase over background has not occurred at the CCR unit. This conclusion will be reached if the data indicate either of the following:

- All detection monitoring constituent concentrations in a compliance well are less than or equal to their respective background UPL; or

- At least one detection monitoring constituent concentration in a well is above the respective background UPL. If this occurs, the well or wells with constituent concentration(s) above the background UPL(s) may be resampled and analyzed for the detection monitoring constituent(s) with exceedances. If the resample indicates that the target detection monitoring constituent concentration(s) in the well or wells is less than or equal to their respective background UPL(s), then it can be concluded that a statistically significant increase over background for all detection monitoring constituents has not occurred since concentrations in one sample of the two independent samples do not exceed the appropriate background UPL(s).

If the groundwater monitoring data indicate that a statistically significant increase over background has not occurred at the CCR wells, then detection monitoring at all CCR wells will

continue on a semi-annual basis.

If one or more detection monitoring constituent concentration in any well is above the respective background UPL in both the original detection monitoring sample and the resample, then a statistically significant increase over background for the target detection monitoring constituents can be concluded. In accordance with 40 C.F.R. § 257.94(e), if a statistically significant increase is indicated, within 90 days the owner/operator shall:

- Establish an assessment monitoring program, or
- Demonstrate that a source other than the CCR unit caused the statistically significant increase over the background UPL for a constituent, or that the statistically significant increase resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality. Per 30 TAC § 352.941, in making an alternative source demonstration, the owner or operator must:
    - Notify the TCEQ executive director, and any local pollution agency with jurisdiction that has requested to be notified, in writing within 14 days that the owner or operator intends to make an alternative source demonstration; and
    - Within 90 days of making a determination of a statistically significant increase over the background value for any Appendix III constituent, submit a report prepared and certified in accordance with 30 TAC § 352.4 (relating to Engineering and Geoscientific Information) to the TCEQ executive director and any local pollution agency with jurisdiction that has requested to be notified, demonstrating that a source other than a CCR unit caused the statistically significant increase or that the statistically significant increase resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality.

The Appendix III detection monitoring prediction limits are summarized in Table 1. Documentation on the statistical procedures used to establish background groundwater quality prediction limits is presented in Appendix C.

3.2 Assessment Monitoring Data Evaluation

Assessment monitoring will be performed at a CCR unit's groundwater monitoring system after a statistically significant increase over background has been confirmed for one or more of the detection monitoring constituents and the statistically significant increase cannot be attributed to a source other than the CCR unit. Within 90 days of obtaining the results from the initial assessment monitoring sampling event, GWPSs will be established for all Appendix IV assessment monitoring constituents as follows:

- For constituents for which an MCL has been established, the GWPS is the highest of the MCL, UPL, or laboratory reporting limit for each constituent; or

- For constituents for which an MCL has not been established, the GWPS is the higher of the UPL, laboratory reporting limit, or alternative GWPS (as applicable for cobalt, lead, lithium, and molybdenum).

The GWPS for each Appendix IV constituent is presented in Table 2.

The 95% LCL for each Appendix IV constituent concentration for each well is compared to the GWPS established for the constituent to ascertain if a statistically significant increase above the GWPS does or does not exist. A statistically significant increase is indicated if the LCL exceeds the GWPS. Additional information on the development of Appendix IV constituent LCLs is provided in Appendix C.

In accordance with 40 C.F.R. § 257.95(g)(3), if a statistically significant increase over GWPSs for any Appendix IV assessment monitoring constituent is confirmed, within 90 days of the initial assessment monitoring event, the owner/operator will either:

- Initiate an assessment of corrective measures for the CCR unit in accordance with 40 C.F.R. § 257.96; or

- Demonstrate that a source other than the CCR unit caused the statistically significant level over the background UPL for a constituent, or that the statistically significant increase resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality. Per 30 TAC § 352.951, in making an alternative source demonstration, the owner or operator must:

    - Notify the TCEQ executive director, and any local pollution agency with jurisdiction that has requested to be notified, in writing within 14 days that the owner or operator intends to make an alternative source demonstration; and

    - Within 90 days of making a determination of a statistically significant increase over the GWPS of any Appendix IV constituent, submit a report prepared and certified in accordance with 30 TAC § 352.4 (relating to Engineering and Geoscientific Information) to the TCEQ executive director, and any local pollution agency with jurisdiction that has requested to be notified, demonstrating that a source other than a CCR unit caused the exceedance or that the exceedance resulted from error in sampling, analysis, statistical evaluation, or natural variation in groundwater quality.

If one or more Appendix IV assessment monitoring constituents are detected at statistically significant levels above their respective GWPS in any sampling event, and if a source other than

the CCR unit cannot be demonstrated to have caused the exceedance, the nature and extent of the release should be further characterized as follows in accordance with 40 C.F.R § 257.95(g)(1):

- Install additional monitoring wells necessary to define the contaminant plume(s);
- Collect data on the nature and estimated quantity of material released including specific information on the Appendix IV assessment monitoring constituents and the levels at which they are present in the material released;
- Install at least one additional monitoring well at the facility boundary in the direction of contaminant migration and sample this well for all Appendix III detection monitoring parameters and for those Appendix IV assessment monitoring constituents that have been detected as part of assessment monitoring. This monitoring must be performed on at least a semi-annual basis thereafter; and
- Sample all wells in accordance with 40 C.F.R § 257.95(d)(1) to characterize the nature and extent of the release.

Order No.: 1510216

RE: Luminant - Martin Lake

Dear Will Vienne:

DHL Analytical, Inc. received 16 sample(s) on 10/23/2015 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAC except where noted in the Case Narrative. All non-NELAC methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-15-15

Subject: CCR Appendix III and IV
Follow Up Flag: Follow up
Flag Status: Completed

Hi John,

Here are the Appendix III and Appendix IV constituents that we will need to have analyzed under the CCR Rule.

Appendix III
Boron
Calcium
Chloride
Fluoride
pH
sulfate
TDS

Appendix IV
Antimony
Arsenic
Barium
Beryllium
Cadmium
Chromium
Cobalt
Fluoride
Lead
Lithium
Mercury
Molybdenum
Selenium
Thallium
Radium 226 and 228

We are looking to have approximately 74 wells sampled 8 times over the course of the next two years. Please let me know if there is any more information you might need.

Cheers,

Sara

Lab Order: 1510216

CASE NARRATIVE

Samples were analyzed using the methods outlined in the following references:

Method SW6020A - Metals Analysis
Method SW7470A - Mercury Analysis
Method E300 - Anions Analysis
Method M4500-H+ B - pH of a Water Analysis
Method M2540C - TDS Analysis

LOG IN

The samples were received and log-in performed on 10/23/15. A total of 16 samples were received. The samples arrived in good condition and were properly packaged.

METALS ANALYSIS

For Metals analysis performed on 11/5/15 Chromium and Molybdenum were detected above the reporting limits in the method blank (MB-72051). All associated samples were below detection limits for these analytes. No further corrective actions were taken.

For Metals analysis performed on 11/5/15 (batch 72051) the matrix spike duplicate recovery was slightly above control limits for Boron and Calcium. These are flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was from this work order. The LCS was within control limits for these analytes. No further corrective actions were taken.

For Metals analysis performed on 11/9/15 (batch 72217) the RPD for the serial dilution was above control limits for Chromium. This is flagged accordingly. The PDS was within control limits for this analyte. No further corrective actions were taken.

For Metals analysis performed on 11/5/15 and 11/9/15 four LCVLs were above control limits for Boron. These are flagged accordingly. The associated CCVs were within control limits for this analyte. No further corrective actions were taken.

ANIONS ANALYSIS

For Anions analysis performed on 11/2/15 the matrix spike duplicate recoveries (1510216-02 MSD & 1510216-07 MSD) were slightly above control limits for Sulfate. These are flagged accordingly in the QC summary report. The samples selected for the matrix spikes and matrix spike duplicates were from this work order. The LCS was within control limits for this analyte. No further corrective actions were taken.
